Name : Mr. SHASHIKANT MERAIYA Collected On : 09-Mar-2024 08:44

Age : 39 Years Gender: Male Pass. No. : Dispatch At :

**Ref. By** : APOLLO : 8141803355

Location :

Test Name		Results	Units	Bio. Ref. Interval
		Complete Blood Count Specimen: EDTA blood		
<u>Hemoglobin</u>				
Hemoglobin(SLS method)	L	12.3	g/dL	13.0 - 17.0
Hematocrit (calculated)		46.9	%	40 - 50
RBC Count(Ele.Impedence)		5.36	X 10^12/L	4.5 - 5.5
MCV (Calculated)		87.5	fL	83 - 101
MCH (Calculated)	L	22.9	pg	27 - 32
MCHC (Calculated)	L	26.2	g/dL	31.5 - 34.5
RDW (Calculated)		24.2	%	
Differential WBC count (Impedance	and flow	4)		
Total WBC count		***	/µL	4000 - 10000
Neutrophils		****	%	38 - 70
Lymphocytes		***	%	21 - 49
Monocytes		****	%	3 - 11
Eosinophils		***	%	0 - 7
Basophils		***		0 - 2
<u>Platelet</u>				
Platelet Count (Ele.Impedence)	Н	2203000	/cmm	150000 - 410000
MPV		11.00	fL	6.5 - 12.0
Sample Type: EDTA Whole Blood				

**Remarks:** Hemolyzed sample and smear shows degenerative changes. Suggest repeat testing from fresh blood for proper cell counts.

Note: All abnormal hemograms are reviewed and confirmed microscopically. Peripheral blood smear and malarial parasite examination are not part of CBC report.

Test done from collected sample.

This is an electronically authenticated report.

As a routine test to determine if your cholesterol level is normal or falls into a borderline-, intermediate- or high-risk category.

To monitor your cholesterol level if you had abnormal results on a previous test or if you have other risk factors for heart disease.

To monitor your body's response to treatment, such as cholesterol medications or lifestyle changes.

To help diagnose other medical conditions, such as liver disease.

Note: biological reference intervals are according to the national cholesterol education program (NCEP) guidelines.

Test done from collected sample.

Test Name	Results	Units	Bio. Ref. Interval
HEMOGLOBIN A1C (HBA1C)	6.30	%	Normal: <= 5.6 Prediabetes: 5.7-6.4 Diabetes: >= 6.5 6-7: Near Normal Glycemia, <7: Goal, 7-8: Good Control, >8: Action Suggested.
Mean Blood Glucose ( Calculated )	134	mg/dL	

Sample Type: EDTA Whole Blood

#### Criteria for the diagnosis of diabetes

- 1. HbA1c >/= 6.5 \* Or Fasting plasma glucose >126 gm/dL. Fasting is defined as no caloric intake at least for 8 hrs. Or
- 2. Two hour plasma glucose >/= 200mg/dL during an oral glucose tolerence test by using a glucose load containing equivalent of 75 gm anhydrous glucose dissolved in water. Or
- 3. In a patient with classic symptoms of hyperglycemia or hyperglycemic crisis, a random plasma glucose >/= 200 mg/dL. \*In the absence of unequivocal hyperglycemia, criteria 1-3 should be confirmed by repeat testing. American diabetes association. Standards of medical care in diabetes 2011. Diabetes care 2011:34:S11.

#### Limitation of HbA1c

- 1) In patients with Hb variants even analytically correct results do not reflect the same level of glycemic control that would be expected in patients with normal population.
- 2) Any cause of shortened erythrocyte survival or decreased mean erythrocyte survival or decreased mean erythrocyte age eg. hemolytic diseases, pregnancy, significant recent/chronic blood loss etc. will reduce exposure of RBC to glucose with consequent decrease in HbA1c values.
- 3) Glycated HbF is not detected by this assay and hence specimens containing high HbF (>10%)may result in lower HbA1c values than expected. Importance of HbA1C (Glycated Hb.) in Diabetes Mellitus
- HbA1C, also known as glycated heamoglobin, is the most important test for the assessment of long term blood glucose control( also called glycemic control).
- HbA1C reflects mean glucose concentration over pas 6-8 weeks and provides a much better indication of longterm glycemic control than blood glucose determination.
- HbA1c is formed by non-enzymatic reaction between glucose and Hb. This reaction is irreversible and therefore remains unaffected by short term fluctuations in blood
- Long term complications of diabetes such as retinopathy (Eye-complications), nephropathy (kidney-complications) and neuropathy (nerve complications), are potentially serious and can lead to blindness, kidney failure, etc.
- Glyemic control monitored by HbA1c measurement using HPLC method (GOLD STANDARD ) is considered most important. (Ref. National Glycohaemoglobin Standardization Program NGSP)

Note: Biological reference intervals are according to American Diabetes Association (ADA) Guidelines.

Test done from collected sample.

Name : Mr. SHASHIKANT MERAIYA Collected On : 09-Mar-2024 08:44

Age : 39 Years Gender: Male Pass. No.: Dispatch At :

**Ref. By** : APOLLO **Tele No.** : 8141803355

Location :

Test Name	Results	Units	Bio. Ref. Interval
	THYROID FL	JNCTION TEST	
T3 (triiodothyronine), Total	0.87	ng/mL	0.70 - 2.04
T4 (Thyroxine),Total	6.84	μg/dL	4.6 - 10.5
TSH (Thyroid stimulating hormone)	H <b>5.163</b>	μIU/mL	0.35 - 4.94

Sample Type: Serum

#### Comments:

Thyroid stimulating hormone (TSH) is synthesized and secreted by the anterior pituitary in response to a negative feedback mechanism involving concentrations of FT3 (free T3) and FT4 (free T4). Additionally, the hypothalamic tripeptide, thyrotropin-relasing hormone (TRH), directly stimulates TSH production. TSH stimulates thyroid cell production and hypertrophy, also stimulate the thyroid gland to synthesize and secrete T3 and T4. Quantification of TSH is significant to differentiate primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low.

#### TSH levels During Pregnancy:

First Trimester: 0.1 to 2.5 µIU/mL
 Second Trimester: 0.2 to 3.0 µIU/mL
 Third trimester: 0.3 to 3.0 µIU/mL

Test Name	Results	Units	Bio. Ref. Interval
Creatinine	0.91	mg/dL	0.67 - 1.5

Pass. No.:

#### Serum

Name

Creatinine is the most common test to assess kidney function. Creatinine levels are converted to reflect kidney function by factoring in age and gender to produce the eGFR (estimated Glomerular Filtration Rate). As the kidney function diminishes, the creatinine level increases; the eGFR will decrease. Creatinine is formed from the metabolism of creatine and phosphocreatine, both of which are principally found in muscle. Thus the amount of creatinine produced is, in large part, dependent upon the individual's muscle mass and tends not to fluctuate much from day-to-day. Creatinine is not protein bound and is freely filtered by glomeruli. All of the filtered creatinine is excreted in the urine.

Test done from collected sample.

This is an electronically authenticated report.

#### Serum

Useful screening test for evaluation of kidney function. Urea is the final degradation product of protein and amino acid metabolism. In protein catabolism, the proteins are broken down to amino acids and deaminated. The ammonia formed in this process is synthesized to urea in the liver. This is the most important catabolic pathway for eliminating excess nitrogen in the human body. Increased blood urea nitrogen (BUN) may be due to prerenal causes (cardiac decompensation, water depletion due to decreased intake and excessive loss, increased protein catabolism, and high protein diet), renal causes (acute glomerulonephritis, chronic nephritis, polycystic kidney disease, nephrosclerosis, and tubular necrosis), and postrenal causes (eg, all types of obstruction of the urinary tract, such as stones, enlarged prostate gland, tumors). The determination of serum BUN currently is the most widely used screening test for the evaluation of kidney function. The test is frequently requested along with the serum creatinine test since simultaneous determination of these 2 compounds appears to aid in the differential diagnosis of prerenal, renal and postrenal hyperuremia.

Chloride(CI-) Method:ISE	104.00	mmol/L	98 - 107

Sample Type: Serum

The electrolyte panel is ordered to identify electrolyte, fluid, or pH imbalance. Electrolyte concentrations are evaluated to assist in investigating conditions that cause electrolyte imbalances such as dehydration, kidney disease, lung diseases, or heart conditions. Repeat testing of the electrolyte or its components may be used to monitor the patient's response to treatment of any condition that may be causing the electrolyte, fluid or pH imbalance.

AGE/SEX:	39 Y/M
DATE:	9-Mar-24

#### **USG ABDOMEN**

LIVER:

normal in size & shows normal echotexture. No evidence of dilated IHBR. No

evidence of focal or diffuse lesion. CBD & Portal vein appears normal.

GALL-

BLADDER:

normal, No evidence of Gall Bladder calculi.

PANCREAS:

appears normal in size & echotexture, No evidence of Peripancreatic fluid

collection.

SPLEEN: KIDNEYS: normal in size & shows normal echogenicity. normal in size & shows normal echotexture

Right kidney measures 11.3 x 4.7 cm. Left kidney measures 10.5 X 4.8 cm.

No evidence of calculi or mass lesion on either side, No evidence of

Hydronephrosis or Hydroureter on either side.

URINARY

BLADDER:

appears partially distension & mild thickened wall thickness. No

evidence of calculus or mass lesion.

PROSTATE:

appear borderline normal in size (vol 25 cc) and echotexture.

## USG WITH HIGH FREQUENCY SOFT TISSUE PROBE:

Bowel loops appears normal in caliber. No evidence of focal or diffuse wall thickening. No collection in RIF. No evidence of Ascites. No evidence of lymphadenopathy.

## CONCLUSION:

Mild thickened urinary bladder wall. Correlation with urine R/M would be of help. Rest study shows no significant abnormality

# 2D ECHO CARDIOGRAPHY & COLOR DOPPLER STUDY

## FINDINGS:-

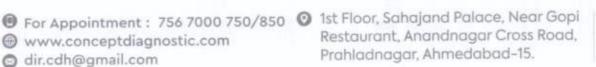

- Normal LV systolic function, LVEF=60%.
- No RWMA at rest.
- Normal LV Compliance.
- LV & LA are of normal size.
- RA & RV are of normal size.
- Intact IAS & IVS.
- All valves are structurally normal.
- No MR, No AR, No PR.
- Trivial TR, No PAH, RVSP=25mmHg.
- No Clots or vegetation.
- No evidence of pericardial effusion.
- IVC is normal in size and preserved respiratory variation.
