PAP SMEAR CYTOLOGY (CONVENTIONAL)

Specimen

Pap smear for cytology (conventional)

Gross Description

Received one unstained smear.
Smear-1 [PAP]

Microscopic

Description See below in

diagnosis. Diagnosis

Satisfactory for evaluation.

PAP Smears is negative for intra-epithelial lesion or malignancy.

Trichomonas or monilia are not seen.

Endocervical cells are not seen.

PAP test is a screening test for cervical cancer with inherent false negative results.

----- End Of Report -----

All cytology tests reveal only cytological characteristics of individual cells and not architectural details which are very important in morphological diagnosis. All cytology methods have their own inherent limitations of false positive and false negative results due to variabilities related to sample collection methods, smear preparation, fixation and staining along with microscopic interpretation, hence whenever required tissue diagnosis and/or immunohistochemistry study after correlation with clinical and radiological findings should be done for further confirmation before any definitive medical or surgical treatment.
