EXPECTED VALUES :-

Metabolically healthy patients	=	4.8 - 5.5 % HbA1C
Good Control	=	5.5 - 6.8 % HbA1C
Fair Control	=	6.8-8.2 % HbA1C
Poor Control	=	>8.2 % HbA1C

REMARKS:-

In vitro quantitative determination of HbA1C in whole blood is utilized in long term monitoring of glycemia

The HbA1C level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 6-8 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose.

It is recommended that the determination of HbA1C be performed at intervals of 4-6 weeks during Diabetes Mellitus therapy.

Results of HbA1C should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

Table with 4 columns: Test Name With Methodology, Result, Unit, Biological Ref.Interval. Rows include T3 (Trilodothyronine), T4 (Thyroxine), and TSH (Ultrasensitive).

Comments:

- Our reference range applies the central 95th interval (2.5th - 97.5th quantile) according to the CLSI/IFCC guidelines EP28-A3c.
A circadian variation in serum TSH in healthy subjects is well documented. TSH level is reaching peak levels between 2-4 am and at a minimum between 6-10 pm. The variation is of the order of 50%, hence time of the day has influence on the value of TSH.
TSH levels between 6.3 and 15.0 may represent subclinical or compensated hypothyroidism or show considerable physiological & seasonal variation, suggest clinical correlation or repeat testing with fresh sample.
TSH levels may be transiently altered because of non-thyroid illness, like severe infection, renal disease, liver disease, heart disease, severe burns, trauma, surgery etc. Few drugs also altered the TSH values.
A high TSH result often means an underactive thyroid gland caused by failure of the gland (hypothyroidism). A low TSH result can indicate an overactive thyroid gland (hyperthyroidism) or damage to the pituitary gland that prevents it from producing TSH.
Resistance to thyroid hormone (RTH) and central hyperthyroidism (TSH-oma) are rare conditions associated with elevated TSH, T4 and T3 levels.

Below mentioned are the guidelines for age reference ranges for T3,T4 and TSH results:

Table with 4 columns: Age, Total T3 (ng/dl), Total T4 (µg/dl), TSH (µIU/ml). Rows include age groups from 1-6 days to >20 years.

TSH Level in pregnancy

Table with 2 columns: Trimester, TSH Level (µIU/ml). Rows include First, Second, and Third Trimester.
