TEST NAME	RESULT	UNIT	BIOLOGICAL REF. RANGE
Thyroid Function Test			
T3 (Triiodothyronine) (ECLIA)	1.86	ng/mL	0.8 - 2.02
T4 (Thyroxine) (ECLIA)	11.48	µg/dL	5.1 - 14.06
TSH (ECLIA)	3.78	µIU/ml	0.27 - 4.2

Interpretation(s)

TSH stimulates the production and secretion of the metabolically active thyroid hormones, thyroxine (T2) and triiodothyronine (T3), by interacting with a specific receptor on the thyroid cell surface. The synthesis and secretion of TSH is stimulated by Thyrotropin releasing hormone (TRM) in response to low levels of circulating thyroid hormones. Elevated Levels of T3 and T4 suppress the production of TSH via a classic negative feedback mechanism. Failure at any level of regulation of the

Hypothalamic-pituitary- thyroid axis will result in either underproduction (hypothyroidism) or overproduction (hyperthyroidism) of T4 and/ or T3

Limitations:

T3 and T4 circulates in reversibly bound form with Thyroid binding globulins (TBG), and to a lesser extent albumin and thyroid binding Pre Albumin, So Conditions in which TBG and protein levels alter Such as pregnancy, excess estrogens, androgens, steroids may falsely affect the T3 and T4 levels. Normal levels of T4 can also be seen in Hyperthyroid patients with: T3 Thyrotoxicosis, hypogroteinemia Or ingestion of certain drugs. Serum T4 levels in neonates and infants are higher than values in the normal adult, due to the increased concentration of TBG in neonate serum. TSH may be normal in central hypothyroidism recent rapid correction of hyperthyroidism or hypothyroidism pregnancy. Phenytoin therapy, Autoimmune disorders may produce spurious results. Various drugs can interfere With the test result, TSH has a diurnal rhythm so values may vary if sample collection is done at different times of the day.
