For routine urine analysis, 15 ml of midstream clean catch urine sample collected in wide mouth open container with tight fitting lid is desirable. Delayed transport, temperature and humidity can deteriorate urine sample quality. Urine routine microscopic examination is a primary investigation for suspected renal disease, urinary tract infection, detection of metabolic disorders such as diabetes mellitus, differential diagnosis of jaundice, and plasma cell dyscrasia. Urine Glucose and albumin measurement at regular interval are essential for analysing the progression of diabetic nephropathy from reversible to irreversible stage.
