HbA1C	5.6		%	4,4-6.2
Estimated average glucose (eAG)	114.02		mg/dl	

Interpretation:

HbA1c result is suggestive of at risk for Diabetes (Prediabetes)/ well controlled Diabetes in a known Diabetic.

Note: Presence of Hemoglobin variants and/or conditions that affect red cell turnover must be considered, particularly when the HbA1C result does not correlate with the patient's blood glucose levels.

FACTORS THAT INTERFERE WITH HbA1C | FACTORS THAT AFFECT INTERPRETATION | MEASUREMENT | OF HBA1C RESULTS |

Hemoglobin variants, elevated fetal hemoglobin (HbF) and chemically modified derivatives of hemoglobin (e.g. carbamylated Hb in patients with renal failure) can affect the accuracy of HbA1c measurements | deficiency anemia is associated with higher HbA1c | Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g., recovery from acute blood loss, hemolytic anemia, HbSS, HbCC, and HbSC) | will falsely lower HbA1c test results | regardless of the assay method used. Iron deficiency anemia is associated with higher HbA1c |
