USG ABDOMEN AND PELVIS

CLINICAL DETAILS: Routine screening.

FINDINGS:

Liver : It is normal in size and shape. It measures 139 mm along maximum craniocaudal axis. It shows raised parenchymal echotexture in both the lobes. No obvious focal lesion is seen. No evidence of intrahepatic biliary radicle dilatation. Common bile duct appears undilated. The hepatic veins and inferior vena cava appears unremarkable. The portal vein appears unremarkable.

Gall Bladder : It is partially distended. No evidence of obvious intraluminal calculus/ mass seen. No evidence of obvious wall thickening or pericholic collection.

Pancreas : It is well visualised. The head, body and tail appears normal in size and shows homogenous bright echotexture. The pancreatic duct appears undilated.

Spleen : is normal in size & shape. It measures 103 mm along its maximum length. It shows normal parenchymal echotexture. No obvious focal lesion is noted.

Kidneys : Right kidney measures 102 x 45 mm in size & Left kidney measures 111 x 43 mm in size. They appear normal in size, shape, location and axis. They show normal parenchymal echotexture with well maintained corticomedullary differentiation. No evidence of hydronephrosis on either side.No focal lesion or calculus is noted on either side.

Urinary Bladder: It is well distended. It shows smooth outlines and internal mucosal regularity with normal wall thickness.No obvious intraluminal calculus/focal lesion is seen.

Prostate :It is normal in size and shows homogenous echotexture. It measures 19 cc in volume. No obvious focal lesions / calcification / abnormal vascularity.

Retro peritoneum is obscured by bowel gases. No obvious enlarged retro peritoneal or mesenteric lymph nodes noted. The visualised bowel loops appear unremarkable. No evidence of obvious bowel wall thickening. No ascites seen.

IMPRESSION:

- **Grade I fatty infiltration of liver.**
- **No other sonographically evident intra-abdominal pathology.**

Clinical correlation recommended.

Dr. Sunita Shewale
Consultant Radiologist

(Because of technical and technological limitation complete diagnosis cannot be assured on imaging sonography. Sonography has its limitation for evaluation of GIT lesion. Clinical correlation, consultation if required repeat imaging required in the event of controversies.)
