USG WHOLE ABDOMEN

(Compromised scan due to excessive bowel gases)

LIVER: is normal in size, measures approx 12.6 cms and shows increased echotexture.

PORTAL VEIN: is not dilated.

GALL BLADDER: is partially distended with normal wall thickness.

CBD: is not dilated with clear lumen. No calculus is seen.

PANCREAS: Visualized part of pancreas is normal in size, shape with normal homogeneous echotexture. **MPD**: is not dilated.

SPLEEN: is normal in size (~8.7 cms) with normal homogeneous echotexture.

RIGHT KIDNEY: is normal in size and echotexture.

- o Cortical echogenicity is normal.
- o Cortico-medullary demarcation is maintained.
- o Parenchymal thickness appears normal.
- o Pelvicalyceal system is not dilated.

LEFT KIDNEY: is normal in size and echotexture.

- o Cortical echogenicity is normal.
- o Cortico-medullary demarcation is maintained.
- o Parenchymal thickness appears normal.
- o Pelvicalyceal system is not dilated.

HAEMATOLOGY

Hb A1c	5.6	%	
--------	-----	---	--

EXPECTED VALUES :-

Metabolically healthy patients	=	4.8 - 5.5 % HbA1c
Good Control	=	5.5 - 6.8 % HbA1c
Fair Control	=	6.8 - 8.2 % HbA1c
Poor Control	=	>8.2 % HbA1c

REMARKS:-

In vitro quantitative determination of HbA1c in whole blood is utilized in long term monitoring of glycemia. The HbA1c level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 6-8 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose. It is recommended that the determination of HbA1c be performed at intervals of 4-6 weeks during Diabetes Mellitus therapy.

Results of HbA1c should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

Note: TSH levels are subject to circadian variation, rising several hours before the onset of sleep, reaching peak levels between 11 pm to 6 am. Nadir concentrations are observed during the afternoon. Diurnal variation in TSH level approximates $\pm 50\%$, hence time of the day has influence on the measured serum TSH concentration.

Assay performed on enhanced chemi luminescence system (Centaur-Siemens)

Serum T3, T4 & TSH measurements form the three components of Thyroid screening panel, useful in diagnosing various disorders of Thyroid gland function.

1. Primary hypothyroidism is accompanied by depressed serum T3 and T4 values and elevated serum TSH level.
2. Primary hyperthyroidism is accompanied by elevated serum T3 and T4 levels along with depressed TSH values.

3. Normal T4 levels are accompanied by increased T3 in patients with T3 thyrotoxicosis.			
4. Slightly elevated T3 levels may be found in pregnancy and estrogen therapy, while depressed levels may be encountered in severe illness, renal failure and during therapy with drugs like propranolol and propyl thiouracil.			
5. Although elevated TSH levels are nearly always indicative of primary hypothyroidism, and may be seen in secondary thyrotoxicosis.

SEROLOGY

TOTAL PSA

0.70 ng/mL

ELFA

INTERPRETATION :

Expected Values :

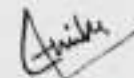

Age (years)	PSA concentrations (ng / mL)	
	Low Limit	High Limit
< 40	0.21	1.72
40 - 49	0.27	2.19
50 - 59	0.27	3.42
60 - 69	0.22	6.16
> 69	0.21	6.77

PSA is reliable tumour marker for already diagnosed prostatic carcinomas. It is uniquely associated only with prostatic tissue, and therefore is specific for it. Baseline levels measured prior to therapeutic intervention and followed later by serial periodical measurements will predict the outcome of therapy. It also helps in early discovery of recurrences, relapses and metastases.

In general, tumor marker levels are directly proportional to the tumour mass and the stage of the cancer. However, it is the rate of change of the tumor marker level which is more important, rather than its absolute value.

A 50% change may be considered clinically significant. It must be emphasised that PSA may also be elevated in benign prostatic hypertrophy and inflammatory conditions of the surrounding genitourinary tract. Therefore, this parameter should never be used as a screening test for diagnosing prostatic carcinomas but only as an aid in follow up studies.
