Target Value is	: 6.5% - 7.5%

ESTIMATED AVERAGE GLUCOSE (eAG)	96.80	65.00 - 135.00	mg/dL
--	-------	----------------	-------

Method : Calculated

REMARKS:-

In vitro quantitative determination of **HbA1c** in whole blood is utilized in long term monitoring of glycemia .The **HbA1c** level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 8 -12 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose.

It is recommended that the determination of **HbA1c** be performed at intervals of 3-6 months during diabetes mellitus therapy. Results of **HbA1c** should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

Estimated average glucose (eAG) - There is a predictable relationship between HbA1c and eAG. It helps people with diabetes to correlate their A1c to daily glucose monitoring levels. It reflects the average glucose levels in the past 2-3 months. The eAG calculation converts the A1c percentage to the same units used by glucometers- mg/dl.
