Test Name	Results	Units	Bio. Ref. Interval
ESR	06	mm/hr	0 - 9

Method:Modified Westergren

Sample Type: EDTA Whole Blood

Interpretation:

An erythrocyte sedimentation rate test, also called an ESR or sed rate test, measures the speed at which red blood cells settle to the bottom of an upright glass test tube. This measurement is important because when abnormal proteins are present in the blood, typically due to inflammation or infection, they cause red blood cells to clump together and sink more quickly, which results in a high ESR value. The ESR is useful in detecting inflammation in the body that may be caused by infection, some cancers, and certain autoimmune diseases such as juvenile idiopathic arthritis, lupus, and Kawasaki disease. The ESR alone can't be used to diagnose any one specific disease, however.

Blood Group "Rh" <i>Agglutination</i>	Positive

Sample Type: EDTA Whole Blood

Interpretation:

1. This report only confirms the Cell grouping of the patient; serum grouping is not performed at our laboratory
2. This report is valid only for the sample received
3. After incubation at 37 degree C for the purpose of confirmation
4. This test does not rule out the possibility of the presence of rare blood group types, ambiguous results such as different blood group typing at different laboratories with different antisera and such cases require further testing at a specialized laboratory.
5. It is advisable to perform serum (reverse) grouping in the cases of negative blood groups.
6. Kindly consult the laboratory personnel for further workup in cases of Rh(D) NEGATIVE Blood groups
7. This blood group report has not been intended for blood transfusion blood group should have been rechecked.
