### Blood Group & RH Factor

SPECIMEN	WHOLE BLOOD		
ABO GROUP	'O'		
RH FACTOR	POSITIVE		
INTERPRETATION			

The ABO system consists of A, B, AB, and O blood types. People with type AB blood are called universal recipients, because they can receive any of the ABO types. People with type O blood are called universal donors, because their blood can be given to people with any of the ABO types. Mismatches with the ABO and Rh blood types are responsible for the most serious, sometimes life-threatening, transfusion reactions. But these types of reactions are rare.

#### Rh system

The Rh system classifies blood as Rh-positive or Rh-negative, based on the presence or absence of Rh antibodies in the blood. People with Rh-positive blood can receive Rh-negative blood, but people with Rh-negative blood will have a transfusion reaction if they receive Rh-positive blood. Transfusion reactions caused by mismatched Rh blood types can be serious.

## Glycosylated Hemoglobin (GHb/HbA1c)

Test Name	Result	Unit	Biological Reference Interval
HbA1c (Glycosylated Haemoglobin)	<b>7.00</b>	%	Below 6.0% : Normal 6.0% 7.0% : Good Control 7.0% - 8.0% : Fair Control 8.0%-10% : Unisatisfactory Above 10% Poor Control
HPLC- H9			
Mean Blood Glucose Calculated	<b>154.2</b>	mg/dL	70 - 125

### CLINICAL SIGNIFICANCE :

Glycosylated Haemoglobin is a accurate and true index of the "Mean Blood Glucose Level " in the body for the previous 2 -3 months.HbA1c is an indicator of glycemic control. HbA1c represents average glycemia over the past six to eight weeks.Glycation of hemoglobin occurs over the entire 120 day life span of the red blood cell but with in this 120 days. Recent glycemia has the largest influence on the HbA1c value. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling 25% in the month before that and the remaining 25% in months two to four.

### Factors affecting HbA1c results:

Increased in: High fetal hemoglobin, Chronic renal failure, Iron deficiency anemia, Splenectomy, Increased serum triglycerides, Alcohol ingestion, Lead/opiate poisoning and Salicylate treatment.  
Decreased in: Shortened RBC lifespan (Hemolytic anemia, blood loss), following transfusions, pregnancy, ingestion of large amount of Vitamin E or Vitamin C and Hemoglobinopathies

Reflex tests: Blood glucose levels, CGM (Continuous Glucose monitoring)

End of Report

Results relate only to the sample as received. Kindly correlate with clinical condition

Note : If the test results are alarming or unexpected, Client is advised to contact the Physician immediately for possible remedial action.

TEST DONE	OBSERVED VALUE	UNIT	REFERENCE RANGE	METHOD
 <b>T3, T4, TSH SERUM</b>				
<b>T3 TOTAL (Triiodothyronine) SERUM ^</b>	0.895	ng/mL	0.80 - 2.00 ng/mL Pregnancy : Last 5 ECLIA months : 1.16 - 2.47

**Interpretation**

Decreased TSH with raised or within range T3 and T4 is seen in primary hyperthyroidism, toxic thyroid nodule, sub-clinical hyper-thyroidism, on thyroxine ingestion, post-partum and gestational thyrotoxicosis Raised TSH with decreased T3 and T4 is seen in hypothyroidism and with intermittent T4 therapy. Alterations in TSH are also seen in non-thyroidal illnesses like HIV infection, chronic active hepatitis ,estrogen producing tumors, pregnancy, new-born, steroids, glucocorticoids and may cause false thyroid levels for thyroid function tests as with increased age ,marked variations in thyroid hormones are seen. In pregnancy T3 and T4 levels are raised, hence FT3 and Ft4 is to be done to determine hyper or hypothyroidism

**NOTE**

Tests marked with ^ are included in NABL scope.

Test results relate to the sample as received.

Marked variations in thyroid hormones are seen with age.

In pregnancy T3 and T4 levels are raised.Hence FT3 and FT4 is recommended to be done to determine hyper or hypothyroidism.

By ECLIA method, false low or false high values can be because of Biotin (Vitamin B7) consumption.
