COMMENTS: Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal. Results are invalidated if the client has undergone a radionuclide scan within 7-14 days before the test. Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved. The production, circulation, and disintegration of thyroid hormones are altered throughout the stages of pregnancy

HighPressure Liquid Chromatography			4.5 - 6.4 %
			Good control : 4.5 - 6.4 %
			Fair control : 6.5 - 7.4 %
			Poor control : Above - 7.5 %

COMMENTS: HbA1c is an indicator of glycemic control. HbA1c represents average glycemia over the past six to eight weeks. Glycation of hemoglobin occurs over the entire 120 day life span of the red blood cell, but with in this 120 days.Recent glycemia has the largest influence on the HbA1c value. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four. Estimated Average Glucose mg/dl = (HbA1c x 35.6) - 77.3) Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only this means that to predict or estimate average glucose from Hb-A1c or vice-versa is not "perfect" but gives a good working ballpark estimate. Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime glucose levels, which are easier to predict and control. As per IFCC recommendations 2007, HbA1c being reported as above maintaining traceability to both IFCC (mmol/mol) & NGSP (%) units.

SERUM URIC ACID	4.38	mg/dL	2.4 - 5.7
-----------------	------	-------	-----------

Comments:

Uric acid is the metabolic end- product of purine metabolism. Increased levels of uric acid in serum (hyperuricemia) are either due to increased synthesis or decreased excretion in urine. This test is used for diagnosis and treatment of renal and metabolic disorders like renal failure, gout, leukemia, Psoriasis, starvation or patients on cytotoxic drugs. Uric acid levels are very labile and show seasonal / day to day variation. Its levels in serum are also increased in emotional stress, starvation and in obese. Hyperuricemia is associated with increased risk for coronary artery disease.

Elevated levels of uric acid seen in - renal failure, gout (up to 25 % of relatives of patients with gout) , asymptomatic hyperuricemia, myelolymphoproliferative disorders, disseminated neoplasms, cancer chemotherapy, hemolytic anemia, sickle cell anemia, resolving pneumonia, toxemia pf pregnancy, psoriasis (one third cases) , metabolic acidosis, von gierks's lead poisoning, Lesch- Nyhan syndrome, maple syrup urine disease, down syndrome, polycystic kidney disease, hypoparathyroidism, primary hyperparathyroidism, hypothyroidism, sarcoidosis and drugs (e.g. diuretics , mitomycin C, Levodopa , phenytoin, barbiturates, ammonia, small doses of salicylates).
