Impression : Bilateral small renal calculi.

Prostate is of normal size for age with regular contours and normal echo-texture. It measures 32 x 41 x 31mm which is equal to 22gms.

Urinary bladder does not show any calculus or mass lesion. No significant wall thickening noted.

No evidence of retro-peritoneal lymphadenopathy/ascites/pleural effusion noted.

Spleen is of normal size and shape. Echotexture is normal. No focal lesion is seen.

Renal artery pulsation appear normal.

Left kidney measures- 102 x 49mm.

No mass or hydronephrotic changes seen.

Left kidney is normal in size and position. It shows normal movements with respiration. Cortical thickness is normal. **3mm calculus is seen in the in the upper pole.**

Renal artery pulsation appear normal.

Right kidney measures- 99 x 51mm.

No mass or hydronephrotic changes seen.

Right kidney is normal in size and position. It shows normal movements with respiration. Cortical thickness is normal. **5.6mm calculus is seen in the in the mid pole.**

Pancreas is of normal size and contour with normal echotexture.

of calculus / wall thickness noted.

Gall bladder is adequately distended with normal intraluminal fluid contents. No evidence

dilated. Hepatic portal veins and the IVC appear normal in caliber.

The liver is normal in size contour and echotexture. Intrahepatic bile ducts and CBD are not

COMMENTS: Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal. Results are invalidated if the client has undergone a radioiodine scan within 7-14 days before the test. Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved. The production, circulation, and disintegration of thyroid hormones are altered throughout the stages of pregnancy.

-----End of Report-----

However, the effect is clinically insignificant, since DRE causes the Most substantial increase in patients with PSA levels already elevated over 4.0 ng/mL. Most PSA in the blood is bound to serum proteins. A small amount is not protein bound and is called free PSA. In men with prostate cancer the ratio of free (unbound) PSA to total PSA is decreased. The risk of cancer increases if the free PSA to total ratio is less than 25%. The lower the ratio the greater the probability of prostate cancer. Measuring the Ratio of free to total PSA appears to be particularly promising for eliminating unnecessary biopsies in men with PSA levels between 4 and 10 ng/mL. However, both and free PSA increase immediately after ejaculation, returning slowly to baseline levels within 24 Hours.

COMMENTS: PSA levels can be also increased by prostate infection, irritation, benign prostatic hyperplasia (BPH) and recent ejaculation, producing a false positive result. Digital rectal examination (DRE) has been shown in several studies to produce an

-----End of Report-----

COMMENTS: HbA1c is an indicator of glycaemic control. HbA1c represents average glycaemia over the past six to eight weeks. Glycation of hemoglobin occurs over the entire 120 day life span of the red blood cell, but with in this 120 days. Recent glycaemia has the largest influence on the HbA1c value. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four. Estimated Average Glucose mg/dl = (HbA1c x 35.6) - 77.3. Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only this means that to predict or estimate average glucose from HbA1c or vice-versa is not "perfect" but gives a good working ballpark estimate. Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime glucose levels, which are easier to predict and control. As per IFCC recommendations 2007, HbA1c being reported as above maintaining traceability to both IFCC (mmol/mol) & NGSP (%) units.

Poor control : Above - >7.0 %

Fair control : 6.6 - 7.0 %

6.1 - 6.5 %

Metabolically healthy patients 4.5 - 6.0 %

COMMENTS: Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal. Results are invalidated if the client has undergone a radionuclide scan within 7-14 days before the test. Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved. The production, circulation, and disintegration of thyroid hormones are altered throughout the stages of pregnancy.

-----End of Report-----

However, the effect is clinically insignificant, since DRE causes the Most substantial increase in patients with PSA levels already elevated over 4.0 ng/mL. Most PSA in the blood is bound to serum proteins. A small amount is not protein bound and is called free PSA. In men with prostate cancer the ratio of free (unbound) PSA to total PSA is decreased. The risk of cancer increases if the free PSA appears to be particularly promising for eliminating unnecessary biopsies in men with PSA levels between 4 and 10 ng/mL. However, both and free PSA increase immediately after ejaculation, returning slowly to baseline levels within 24 Hours.

COMMENTS: PSA levels can be also increased by prostate infection, irritation, benign prostatic hyperplasia (BPH) and recent ejaculation, producing a false positive result. Digital rectal examination (DRE) has been shown in several studies to produce an

HEMATOLOGY

TEST NAME	RESULT	UNIT	RANGE	METHOD
COMPLETE BLOOD COUNT	13.7	g/dl	13.0 - 17.0	Colorimetric
HEMOGLOBIN	6.8	10 ³ /uL	4.0-11.0	Electrical impedance
TOTAL LEUCOCYTE COUNT	60	%	40-75	Electrical impedance
DIFFERENTIAL LEUCOCYTE COUNT(DLC)	32	%	20-45	Electrical impedance
Neutrophil	02	%	01-06	Microscopy
Eosinophil	06	%	2-10	Microscopy
Monocyte	00	%	0-2	Microscopy
Basophil	20	mm/1sthr	0-20	Westergren's
ESR	4.58	mm/1sthr	4.50 - 5.50	Electrical impedance
RBC COUNT	41	%	40 - 50	Calculated
PCV	88.90	Pl	83.00 - 101.00	Calculated
MCV	29.8	Picogram	27.0 - 32.0	Calculated
MCHC	33.60	gm/dl	31.50 - 34.50	Calculated
PLATELET COUNT	150	10 ³ /uL	150 - 410	Electrical impedance

HR : 91 bpm
P : 102 ms
PR : 166 ms
QRS : 80 ms
QT/QTcBz : 324/399 ms
P/QRS/T : 31/12/-3 °
RV5/SV1 : 1.32/30.792 mV

Diagnosis Information:

Sinus rhythm
Possible sequence error: V2,V3 omitted
Lateral ST elevation - possible early repolarization
Inferior T wave abnormality is nonspecific
Borderline ECG

Report Confirmed by:

Dr. Anil Sahoo

X-RAY CHEST

Indication: Routine check-up.

Image quality:-

No evidence of rotation.

PA view. Normal penetration.

Airway:- Trachea central.

Carina & bronchi are normal.

No hilar abnormality.

Lung fields:- Clear.

Cardiac:- Cardiac borders are visible.

Normal heart size.

Diaphragm:- Costophrenic angles on right & left are normal.

Cardiophrenic angles on right & left are normal.

Diaphragm portion are normal.

Bony cage:- No evidence of bony lesion/fracture seen.

No evidence of cervical ribs is seen.

Impression: No significant abnormality detected.

Please correlate clinically.
