Investigation	Value	Unit	Biological Ref. Range
Glucose (Fasting)	99.00	mg/dL	60.00 - 110.00

Fasting Plasma Glucose (mg/dl)	2 hr plasma Glucose (mg/dl) Post Glucose load	Diagnosis		
99 or below	139 or below	Normal		
100 to 125	140 to 199	Pre-Diabetes (IGT)		
126 or above	200 or above	Diabetes		

Reference : American Diabetes Association.

Comment :

Impaired glucose tolerance (IGT) fasting, means a person has an increased risk of developing type 2 diabetes but does not have

it yet. A level of 126 mg/dL or above, confirmed by repeating the test on another day, means a person has diabetes. IGT (2 hrs Post meal), means a person has an increased risk of developing type 2 diabetes but does not have it yet. A 2-hour glucose level of 200 mg/dL or above, confirmed by repeatig the test on another day, means a person has diabetes

Plasma Glucose Goals	For people with Diabetes
Before meal	70-130 mg/dL
2 Hours after meal	Less than 180 mg/dL
HbA1c	Less than 7%

Note: 1. These report are mere estimation and are liable to vary / Change in different conditions in different laboratories. 2. The values are to be corroborated with clinical finding and any alarming or unexpected result should be referred to this lab urgently. 3. These reports are not valid for medico legal purposes.

Investigation		Value	Unit	Biolo	ogical Ref. Range
Erythrocyte Sed	imentation Rate (ESR)	22	mm in 1hr	00 -	20

\* Test conducted on EDTA whole blood at 37 degree Celsius.

\* ESR is an index of the presence of the active diseases of many types.

\* Increased- in most infections, anaemias, injection of foreign proteins, auto-immune disorders, conditions accompanied by hyperglobunemia and hypercholesterolaemia.

\* A rising ESR suggests a progressive disease.

\* Decreased- in polycythemia, congestive heart failure.

\* ESR is a useful but nonspecific marker of underlying inflammation. C-Reactive Protein(CRP) is the recommended test in a acute inflammatory conditions.

Investigation		Value	Unit	Biolo	ogical Ref. Range

		•••••	
Glycosylated Hb	5.3	%	
Average Plasma Glucose	105		

### Interpretation :

HbA1c %	
<=5.6	Normal
5.7-6.4	At Risk for
	Diabetes
>=6.5	Diabetes

Estimated Average Glucose (eAG) is a new way to understand how well you are managing your diabetes. Using eAG may help you get a better idea of how well you are taking care of your diabetes. And that can help you and your health care provider know what changes you may need to make to be as healthy as possible.

	_										
HbA1c %	5	5.5	6	6.5	7	7.5	8	9	10	11	12
(eAG) mg/dL	97	111	126	140	154	169	183	212	240	269	298

The HbA1c goal for people with diabetes is less than 7 percent. A 3 to 6 monthly monitoring is recommended in diabetics. People with diabetes should get the test done more often if their blood sugar stays too high or if their healthcare provider makes any change in the treatment plan. HbA1c concentration represents the integrated values for blood glucose over the preceding 6 -10 wks and is not affected by daily glucose fluctuation, exercise & recent food intake. It is a more useful tool for clinical management of *Diabetes mellitus* through routine monitoring & assesses compliance with therapeutic regimen.

Note: 1. These report are more estimation and are liable to vary / Change in different conditions in different laboratories.
 2. The values are to be corroborated with clinical finding and any alarming or unexpected result should be referred to this lab urgently.
 3. These reports are not valid for medico legal purposes.

Blood group Gel Technique "O" Positive

Blood group is identified by antigens and antibodies present in the blood. Antigens are protein molecules found on the surface of red blood cells. Antibodies are found in plasma. To determine blood group, red cells are mixed with different antibody solutions to give A,B,O or AB. The test is performed by both forward as well as reverse grouping methods.

The report is of sample received. It is presumed that the sample belongs to the patient. In case of any discrepancy related to this report, contact lab.

Globulin Calculated	2.51	g/dL	2.30 - 3.50
A:G (Albumin:Globulin) Ratio	1.64		1.20 - 2.00

These are group of tests that can be used to detect the presence of liver disease, distinguish among different types of liver disorders, gauge the extent of knownliver damage, and monitor the response to treatment. Most liver diseases cause only mild symptoms initially, but these diseases must be detected early. Sometests are associated with functionality (e.g., albumin), some with cellular integrity (e.g., transaminase), and some with conditions linked to the biliary tract(gamma-glutamyl transferase and alkaline phosphatase).Conditions with elevated levels of ALT and AST include hepatitis A,B,C, paracetamol toxicityetc.Several biochemical tests are useful in the evaluationand management of patients with hepatic dysfunction. Some or all of these measurements are alsocarried out (usually about twice a year for routine cases) on those individuals taking certain medications, such as anticonvulsants, to ensure that the medicationsare not adversely impacting the person's liver. Reference ranges vary between laboratories

.Note : The result obtained relate only to the sample given/received & tested. A single test result is not always indicative of a disease, it has to be correlated with clinical data for interpretation

Note: 1. These report are more estimation and are liable to vary / Change in different conditions in different laboratories.
 2. The values are to be corroborated with clinical finding and any alarming or unexpected result should be referred to this lab urgently.
 3. These reports are not valid for medico legal purposes.

Investigation	Value	Unit	Biological Ref. Range
	Kidney Function Te	<u>st</u>	
Urea, Serum <sub>Urease</sub>	22.00	mg/dL	13.00 - 43.00
Blood Urea Nitrogen	10.28	mg/dL	7.00 - 21.00
Creatinine Modified jaffe's	0.58	mg/dL	0.60 - 1.30
Uric Acid, Serum	4.20	mg/dL	2.60 - 6.00
Calcium Arsenazo III	9.20	mg/dl	8.40 - 10.20
Phosphorus UV PHOTOMETRIC	3.49	mg/dL	2.60 - 4.50
BUN Creatinine Ratio	17.72	Ratio	6.00 - 22.00

Kidney function tests are group of tests that can be used to evaluate how well the kidneys are functioning. Creatinine is awaste product that comes from protein in the diet and also comes from the normal wear and tear of muscles of the body. Inblood, it is a marker of GFR .in urine, it can remove the need for 24-hour collections for many analytes or be used as a qualityassurance tool to assess the accuracy of a 24-hour collection Higher levels may be a sign that the kidneys are not workingproperly. As kidney disease progresses, the level of creatinine and urea in the blood increases. Certain drugs are nephrotoxichence KFT is done before and after initiation of treatment with these drugs.Low serum creatinine values are rare; they almost always reflect low muscle mass.Apart from renal failure Blood Urea can increase in dehydration and Gl bleed.Reference ranges vary between laboratories.

Note : The result obtained relate only to the sample given/ received & tested. A single test result is not always indicative of a disease, it has to be correlated with clinical data for interpretation.

Lipid profile is a panel of blood tests that serves as an initial screening tool for abnormalities in lipids, such as cholesterol and triglycerides. The results of this test can identify certain genetic diseases and can determine approximate risks cardiovascular disease, certain forms of pancreatitis. Hypertriglyceridemia is indicative of insulin resistance when present with low high-density lipoprotein (HDL) and elevated low-density lipoprotein (LDL), while elevated triglyceride is a clinical risk factor for coronary artery disease (CAD), especially when low HDL is present. Very high levels of triglycerides are defined by serum levels of 500mg/dL or greater and can be concerning for development of pancreatitis. Reference range between laboratories.
