INTERPRETATION

TRIGLYCERIDE:- Level > 250mg/dL is associated with an approximately 2-fold greater risk of coronary vascular disease. Elevation of triglycerides can be seen with obesity, medication, fast less than 12 hrs., alcohol intake, diabetes melitus, and pancreatitis.

CHOLESTEROL:- Its fractions and triglycerides are the important plasma lipids in defining cardiovascular risk factors and in the management of cardiovascular disease. Highest acceptable and optimum values of cholesterol values of cholesterol vary with age. Values above 220 mgm/dl are associated with increased risk of CHD regardless of HDL & LDL values.

HDL-CHOLESTEROL:- Level <35 mg/dL is associated with an increased risk of coronary vascular disease even in the face of desirable levels of cholesterol and LDL - cholesterol.

LDL - CHOLESTEROL & TOTAL CHOLESTEROL:- Levels can be strikingly altered by thyroid, renal and liver disease as well as hereditary factors. Based on total cholesterol, LDL-cholesterol, and total cholesterol/HDL - cholesterol ratio, patients may be divided into the three risk categories :-

	<u>CHOLESTEROL</u>	<u>LDL-CHOLESTEROL</u>	<u>CHO/HDL RATIO</u>
Acceptable/Low Risk	: < 200 mg/dL	: <130 mg/dL	: < 4.5
Borderline High Risk	: 200-239 mg/dL	: 130-159 mg/dl	: 4.5 - 6.0
High Risk	: > 240 mg /dL	: > 160 mg/dL	: > 6.0

APO A1 & APO B:- Recent studies have shown that Apolipoproteins A1 & B might be the best indicators of Coronary Artery Disease risk in an individual. Patients who have normal lipid profile may have abnormal Apo A1 & Apo B values. Ratio of Apo B : Apo A1 is >1 in cases of increased CHD risk.

NOTE: The prostate-specific antigen (PSA) values should be interpreted in accordance with current clinical guidelines for defining biochemical recurrence following radical prostatectomy (e.g., The 2013 American Urological Association (AUA) Guidelines or the 2015 European Association of Urology (EAU)). These guidelines define biochemical recurrence of prostate cancer as a detectable or rising PSA value post-radical prostatectomy that is ≥ 0.2 ng/mL (ug/L) with a second confirmatory level of ≥ 0.2 ng/mL (ug/L).

COMMENT: In rheumatoid arthritis, diagnostically useful autoantibodies termed as "Rheumatoid factors" (RF) can be detected which are immunoglobulins of the class IgM, IgG, IgA and IgE. Practically, IgM class RF with specificity to human IgG (Fc) is the most useful prognostic marker of RA. Rheumatoid factors are not exclusively found in rheumatoid arthritis but sometimes in normal healthy individuals, chronic infections, syphilis, systemic lupus erythematosus, hepatitis, hypergammaglobulinemia also. Some people who have rheumatoid arthritis may have negative rheumatoid factor in their blood. Therefore, it is recommended that results of the test should be correlated with clinical findings to arrive at the final diagnosis.
