Guidelines for Total Blood Cholesterol Levels on 11 to 12 hour fasting samples.

Desirable : Less than 200 mg/dl

Borderline High Risk : 200 to 239 mg/dl

High Risk : 240 mg/dl and over, on repeated values

Optimal Level for Cardiac Patients : Less than 200 mg/dl

HDL-C : High HDL has generally been found to be protective, decreasing the risk of coronary Artery disease (CAD) in most people. However, some recent studies have shown that in some people with high HDL, the HDL is not protective and may, in fact result in higher risk for CAD than in people with normal HDL levels. In one study it was shown that people with CAD and high HDL had underlying genetic anomalies in enzymes important in lipid turnover. Another study showed that high levels of abnormally large HDL particles were associated with increased risk of CAD. Factors that elevate HDL concentrations include chronic alcoholism, treatment with oral estrogen replacement therapy, extensive aerobic exercise, and treatment with niacin, statins, or fibrates. Smoking reduces levels of HDL cholesterol, while quitting smoking leads to a rise in the plasma HDL level.

Triglycerides Female 40 - 140
Male 60 - 165

Adult levels:

Optimal <100 mg/dL

Near Optimal/ above optimal 100 -129 mg/dL

Borderline high 130 - 159 mg/dL

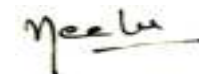

High 160 - 189 mg/dL

Very High ≥190 mg/dL

KIDNEY FUNCTION TEST (KFT)

Total T4 ,Serum Plain	9.20	ug/dl	5.20 - 12.70
TSH	2.56	uIU/ml	0.30 - 4.50

Comment :

Age Group	Biological Reference Range
1-2 Days	3.2-3.43 uIU/ml
3-4 Days	0.7-15.4 uIU/ml
15 Days - 5 Months	1.7-9.1 uIU/ml
5 Months - 2 Years	0.7-6.4 uIU/ml
2 Years - 12 Years	0.64-6.27 uIU/ml
12 Years - 18 Years	0.51-4.94 uIU/ml
> 18 Years	0.35-5.50 uIU/ml

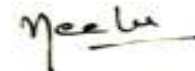

Adults

Note: TSH levels are subject to circadian variation, rising several hours before the onset of sleep, reaching peak levels between 11 pm to 6 am. Nadir concentrations are observed during the afternoon. Diurnal variation in TSH level approximates + 50 %, hence time of the day has influence on the measured serum TSH concentration. Although elevated TSH levels are nearly always indicative of primary hypothyroidism, and may be seen in secondary thyrotoxicosis.

Newborn

In a very low birth weight baby (particularly premature neonates) immaturity of the hypothalamic-pituitary - thyroid axis may mask primary congenital hypothyroidism. It is recommended that the test be repeated two weeks after birth in babies 1000-1500 gm and at four weeks in those <1000 gm. Specimen collection prior to 24 hours of age, after blood transfusion and prematurity can affect this screening.

Nearly 90% of CH cases are detected by newborn screening. A small number of children may test normal on the newborn screen but later develop hypothyroidism.

Vitamin B12 (Cynocobalamin) ,Serum Plain **556.0** pg/mL 200.0 - 1100.0
Method : CLIA

Comments:-

Vitamin B12 along with folate is essential for DNA synthesis and myelin formation. Vitamin B12 deficiency can be because of nutritional deficiency, malabsorption and other gastrointestinal causes. The test is ordered primarily to help diagnose the cause of macrocytic/megaloblastic anemia .

Decreased levels are seen in:

Anaemia, normal near term pregnancy, vegetarianism,partial gastrectomy/ileal damage, celiac disease, with oral contraceptive use, parasitic competition, pancreatic deficiency, treated epilepsy, smoking, hemodialysis andadvancing age.

Increased levels are seen in:

Renal failure, hepatocellular disorders, myeloproliferative disorders and at times with excess supplementation of vitamins pills.

Vitamin D (25 Hydroxy) ,Serum Plain **16.60** ng/mL 30.00 - 100.00

Normal Range

Deficiency < 10 ng/ml
Insufficiency 10 - 29 ng/ml
Sufficiency 30 - 100 ng/ml
Toxicity >100 ng/ml

Comments

Cholecalciferol (Vitamin D3) is synthesized in the skin from 7 dehydrocholesterol in response to sunlight; some part also comes from diet and supplements. Ergocalciferol(vitamin D2) comes essentially from diet and supplements. Both cholecalciferol and ergocalciferol are converted in liver to 25 OH Vitamin D which is considered the best indicator of Vitamin D nutritional status. Vitamin D toxicity is recognized, but is a rare occurrence.

Total PSA ,Serum Plain **0.10** ng/ml 0.00 - 4.00

Increased Value is seen in Benign Prostatic Hypertrophy(BPH), Prostatitis, or Prostate Cancer .

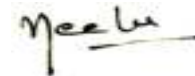

When total PSA concentration is <2.0 ng/ml, the probability of prostate cancer in asymptomatic men is low.

When total PSA concentration is >10.0 ng/mL, the probability of cancer is high and prostate biopsy is generally recommended.

The Total PSA range of 4.0 to 10.0 ng/ml has been described as a diagnostic "gray zone," in which the Free:Total PSA ratio helps to determine the relative risk of prostate cancer.

Therefore, some urologists recommend using the Free:Total ratio to help select which men should undergo biopsy.

However even a negative result of prostate biopsy does not rule-out prostate cancer. Up to 20% of men with negative biopsy results have subsequently been found to have cancer.

Higher total PSA levels and lower percentages of free PSA are associated with higher risks of prostate cancer. Based on free:total PSA ratio: the percent probability of finding prostate cancer on a needle biopsy by age in years:

Free PSA as a percent of Total PSA	Probabilty of carcinoma prostate when Total PSA is 4.1 - 10.0 ng / ml
>=	26.8 %
20 - 25	16 %
15 - 20	20 %
10 - 15	28 %
0 - 10	56 %

Comments:-

False negative / positive results are observed in patients receiving mouse monoclonal antibodies for diagnosis or therapy. PSA total and free levels may appear consistently elevated / depressed due to the interference by heterophilic antibodies and nonspecific protein binding. Results obtained with different assay kits cannot be used interchangeably. All results should be correlated with clinical findings and results of other investigations
