Erythrocyte sedimentation rate (ESR) is a non - specific phenomena and is clinically useful in the diagnosis and monitoring of disorders associated with an increased production of acute phase reactants. The ESR is increased in pregnancy from about the 3rd month and returns to normal by the 4th week post partum. ESR is influenced by age, sex, menstrual cycle and drugs (eg. corticosteroids, contraceptives). It is especially low (0 -1mm) in polycythaemia, hypofibrinogenemia or congestive cardiac failure and when there are abnormalities of the red cells such as poikilocytosis, spherocytosis or sickle cells.

A normal ESR cannot be taken to exclude organic diseases, but nevertheless in the majority of acute and chronic infections, the ESR is raised. ESR increases with age and in men and women over the age of 60 years. An ESR of 30 mm at the end of first hour or more may be present without any obvious causes.

LIPID PROFILE

Specimen:SERUM

TOTAL CHOLESTEROL (CHOD-PAP)	: 177	mg/dL	< 200	02/12/2023 14:16
TRIGLYCERIDES (GPO METHOD)	: 162.1	mg/dL	< 161	02/12/2023 14:16
H D L CHOLESTEROL (PEGME)	: 50.9	mg %	30 - 65	02/12/2023 14:16
L D L CHOLESTEROL Calculated	: 93.7	mg %	74 - 130	02/12/2023 14:16
V L D L Calculated	: 32.4	mg %	10 - 32	02/12/2023 14:16
TOTAL CHO / HDL RATIO Calculated	: 3.5			02/12/2023 14:16
LDL / HDL CHOLESTEROL RATIO Calculated	: 1.8		0.00 - 3.55	02/12/2023 14:16

INTERPRETATION:

TRIGLYCERIDE level > 250mg/dL is associated with an approximately 2-fold greater risk of coronary vascular disease. Elevation of triglycerides can be seen with obesity, medication, fast less than 12hrs., alcohol intake, diabetes mellitus, and pancreatitis.

Normal : < 161 mg/dl
 High : 161 - 199 mg/dl

High : 161 - 199 mg/dl
 Hypertriglyceridemic : 200 - 499 mg/dl
 Very high : > 499 mg/dl

CHOLESTEROL, its fractions and triglycerides are the important plasma lipids in defining cardiovascular risk factors and in the management of cardiovascular disease. Highest acceptable and optimum values of cholesterol values of cholesterol vary with age. Values above 220 mg/dl are associated with increased risk of CHD regardless of HDL & LDL values.

HDL-CHOLESTEROL level <35 mg/dL is associated with an increased risk of coronary vascular disease even in the face of desirable levels of cholesterol and LDL - cholesterol.

LDL - CHOLESTEROL & TOTAL CHOLESTEROL levels can be strikingly altered by thyroid, renal and liver disease as well as hereditary factors. Based on total cholesterol, LDL- cholesterol, and total cholesterol/HDL - cholesterol ratio, patients may be divided into the three risk categories.

Specimen:SERUM

T3, Total Tri Iodothyronine (CLIA)	: 135.9	ng/dL	69 - 215	02/12/2023 18:17
T4, Total Thyroxine (CLIA)	: 6.539	ug/dl	5.2 - 12.7	02/12/2023 18:17
TSH Ultrasensitive CLIA	: 2.952	uIU/ML	0.3 - 4.5	02/12/2023 18:17

Interpretation:

1. An abnormal TSH result should be followed by additional tests to investigate the cause of increase or decrease.
2. Many medications like aspirin and thyroid replacement therapy may affect the thyroid gland function results.
3. Extreme stress and acute illness may affect TSH results. Results may be low in first trimester of pregnancy.
4. The following table summarises test results and their potential meaning:

TSH	T4	T3	Interpretation
High	Normal	Normal	Mild (subclinical) hypothyroidism.
High	Low	Low or Normal	Hypothyroidism.
Low	Normal	Normal	Mild (subclinical) hyperthyroidism.
Low	High or Normal	High or Normal	Hyperthyroidism.
Low	Low or Normal	Low or Normal	Non-thyroidal illness.; rare pituitary (secondary) hypothyroidism.

Liver function tests (LFT) are used to diagnose and monitor liver disease or damage. Levels that are higher or lower than normal can indicate liver problems. These are a group of tests which are helpful to screen for liver infections; determine how well a treatment is working or measure the severity of a disease or monitor possible side effects of medications.

---	--------	-------	----------	------------------

Interpretation :

American Diabetes Association Guideline(Criteria for the diagnosis of Diabetes)

FPG \geq 126mg/dL (7.0 mmol/L). Fasting is defined as no caloric intake for at least 8 hrs.

OR

2-h PG \geq 200 mg/dL (11.1 mmol/L) during OGTT. The test should be performed as described by the WHO, using a glucose load containing the equivalent of 75 g anhydrous glucose dissolved in water.

OR

A1C \geq 6.5% (48 mmol/mol). The test should be performed in a laboratory using a method that is NGSP certified and standardized to the DCCT assay.

OR

In a patient with classic symptoms of hyperglycemia or hyperglycemia crisis, a random plasma glucose \geq 200 mg/dL (11.1 mmol/L).

DCCT, Diabetes Control and Complications Trial; FPG fasting plasma glucose; OGTT, oral glucose tolerance test; WHO, World Health Organization; 2-h PG, 2-h plasma glucose.

In the absence of unequivocal hyperglycemia, diagnosis requires two abnormal test results from the same sample or in two separate test samples.

Comments:-

Haemoglobin A1c (HbA1c) correlates with a time weighted average of plasma glucose values over the previous 3 to 10 weeks. The measurement of HbA1c is therefore a reflection of glucose control over a far longer period than a blood glucose value and it remains unaffected by the short term fluctuation in blood sugar levels.
