### Blood Group & RH Factor

|                |             |
|----------------|-------------|
| SPECIMEN       | WHOLE BLOOD |
| ABO GROUP      | A           |
| RH FACTOR      | POSITIVE    |
| INTERPRETATION |             |

The ABO system consists of A, B, AB, and O blood types. People with type AB blood are called universal recipients, which means they can receive any of the ABO types. People with type O blood are called universal donors, because their blood can be given to people with any of the ABO types. Mismatches with the ABO and Rh blood types are often cause for the most serious, sometimes life-threatening, transfusion reactions. But these types of reactions are rare.

### Rh system

The Rh system classifies blood as Rh-positive or Rh-negative based on the presence or absence of Rh and other proteins. People with Rh-positive blood can receive Rh-negative blood, but people with Rh-negative blood will get a transfusion reaction if they receive Rh-positive blood. Rh-positive and Rh-negative mismatched Rh blood types can be fatal.
