ABDOMINAL SONOGRAPHY

Liver is of normal size, shape, has smooth margins & regular contours and the parenchyma is mildly hyperechoic in echostructure, **fatty changes ( Grade I )**. No focal lesion.

Gall bladder is of normal size, shape, has thin walls & the contents are clear fluid. No evidence of any calculus. Biliary tree is undilated.

Pancreas is normal, no focal / diffuse pathology. Spleen is normal. The Portal and splenic veins are normal in calibre.

Both Kidneys are normal in size [ measure about 11 cms. in length ], shape and echostructure. No calculus in both. The collecting system and ureter on both side are undilated.

Urinary bladder is normal in size, shape & has thin walls.

Prostate is of normal size ( around 17 gms.) & is normal in echostructure.

There is no ascitis. No obvious abdominal lymphadenopathy. No sub / supra diaphragmatic pathology on either side.

IMPRESSION:

Fatty changes in liver ( Grade I ).

### INTERPRETATIONS

- Circulating TSH measurement has been used for screening for euthyroidism, screening and diagnosis for hyperthyroidism & hypothyroidism. Suppressed TSH (<0.01 µIU/mL) suggests a diagnosis of hyperthyroidism and elevated concentration (>7 µIU/mL) suggest hypothyroidism. TSH levels may be affected by acute illness and several medications including dopamine and glucocorticoids. Decreased (low or undetectable) in Graves disease. Increased in TSH secreting pituitary adenoma (secondary hyperthyroidism), PPTH and in hypothalamic disease thyrotropin (tertiary hyperthyroidism). Elevated in hypothyroidism (along with decreased T4) except for pituitary & hypothalamic disease.
- Mild to modest elevations in patient with normal T3 & T4 levels indicates impaired thyroid hormone reserves & incipient hypothyroidism (subclinical hypothyroidism).
- Mild to modest decrease with normal T3 & T4 indicates subclinical hyperthyroidism.
- Degree of TSH suppression does not reflect the severity of hyperthyroidism, therefore, measurement of free thyroid hormone levels is required in patient with a suppressed TSH level.

### CAUTIONS

Sick, hospitalized patients may have falsely low or transiently elevated thyroid stimulating hormone. Some patients who have been exposed to animal antigens, either in the environment or as part of treatment or imaging procedure, may have circulating antianimal antibodies present. These antibodies may interfere with the assay reagents to produce unreliable results.

<b>Prostate Specific Antigen</b> CMIA	<b>0.6330</b>	ng/mL	0.00 - 4.00	
------------------------------------------	---------------	-------	-------------	--

**INTERPRETATIONS:**

Useful for Evaluating patients with documented prostate problems in whom multiple prostate-specific antigen tests may be necessary per year. Monitoring patients with a history of prostate cancer as an early indicator of recurrence and response to treatment. Prostate-specific antigen (PSA) values are reported with the 95th percentile limits by decade of age. These reference limits include men with benign prostatic hyperplasia. They exclude all cases with proven cancer. PSA values exceeding the age-specific limits are suspicious for prostate disease, but further testing, such as prostate biopsy, is needed to diagnose prostate pathology. Values >0.2 ng/mL are considered evidence of biochemical recurrence of cancer in men after prostatectomy.

**CAUTIONS:**

Serum markers are not specific for malignancy, and values may vary by method. When age is not supplied, the results cannot be flagged as high or low. Digital rectal examination generally does not increase normal prostate-specific antigen (PSA) values. However, cystoscopy, urethral instrumentation, and prostate biopsy may increase PSA levels. Some patients who have been exposed to animal antigens, either in the environment or as part of treatment or imaging procedure, may have circulating antianimal antibodies present. These antibodies may interfere with the assay reagents to produce unreliable results.

- If total PSA is above cut off value (between 4 to 20 ng/ml) free PSA should be advised to differentiate benign prostatic hyperplasia from prostatic malignancy.
- Free PSA levels above 20 to 25 % of total PSA are more likely to be associated with BPH.
- Prostate biopsy is required for the diagnosis of cancer. **Tumor marker results obtained can vary due to differences in assay methods and reagent specificity. Patient results determined by assays using different manufacturers for methods may not be comparable.**

**RELATIONSHIP BETWEEN PROBABILITY OF PROSTATE MALIGNANCY & FREE PSA% TO TOTAL PSA**

..... Free PSA % to total PSA	0-10%	10-15%	15-20%	20-25%	>25%
fr Probability of malignancy	56%	28%	20%	16%	8%

**DILUTION PROTOCOL:**

At our lab with kit, manual dilution protocol has been validated for PSA up to 1:20 dilution and result up to 2000 NG/ML. After above dilution, it will be done manually and because of Ag-Ab reaction curve it may be erroneous if diluted after validated dilution.  
\* Test results, interpretation & notes are meant for Medical Personal only.
