Decreased levels are found in malabsorption, malnutrition, hypothyroidism, sepsis and liver disease.</small>				
Triglycerides	95.65	mg/dl	GPO	60 - 150 (M) 40 - 130 (F)
<small>Triglycerides are lipid composed by three absorbed from diet and those endogenously produced from carbohydrates. Their measurement is important for the diagnosis and control of hyperlipidemia. These diseases may have genetic origin or be secondary to others such as nephrosis, diabetes mellitus and endocrine dysfunction. Increase of triglycerides has been identified as a risk factor for atherosclerotic diseases.</small>				
HDL Cholesterol	30.25	mg/dl	PTA	30 - 70 (M) 35 - 90 (F)
<small>Cholesterol from liver is transported to various tissue cells by low density lipoproteins, very low density lipoproteins and chylomicrons through blood (lipid) circulation. It is also synthesized by the cells in animal. The excess cholesterol is transported back to liver by high density lipoproteins (HDL). High density lipoproteins, therefore, are indicative of level where it is either converted to the bile salts or is excreted in bile. Elevated levels of HDL cholesterol suggest a balanced status of cholesterol metabolism in tissue. Lower than normal levels of high density lipoprotein cholesterol are associated with higher risks of atherosclerosis i.e. Deposition of cholesterol in cells of blood vessels and contributes like hypertension, coronary heart disease (CHD) related to it.</small>				
LDL Cholesterol	56.68	mg/dl	Calculated	70 - 150
VLDL Cholesterol	29.34	mg/dl	Calculated	5.0 - 30
Total Chol/HDL	2.90	-----	Calculated	0.00 - 4.90
LDL/HDL	0.86	-----	Calculated	0.00 - 3.55
