**Name** : Mr. Tarunkumar A Chaudhari  
**Sex/Age** : Male/41 Years  
**Ref. By** :  
**Client Name** : Mediwheel

**Reg. No** : 403100656  
**Reg. Date** : 09-Mar-2024 09:37 AM  
**Collected On** :  
**Report Date** : 09-Mar-2024 04:20 PM

**Medical Summary**

**GENERAL EXAMINATION**

Height (cms) : 161

Weight (kgs) : 73.5

Blood Pressure : 130/80mmHg

Pulse : 83/Min

No Clubbing/Cynosis/Pallor/Pedel Oedem

Systemic Examination:

Cardio vascular System - S1,S2 Normal, No Murmur

Respiratory system - AEBE

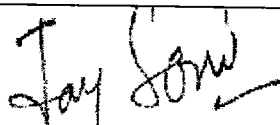

Central Nervous System - No FND

Abdomen - Soft, Non Tender, No Organomegaly

Epilepsy – N/A

|--|----|-------|---------------------|

**ERYTHRO SEDIMENTATION RATE, BLOOD -**

Erythrocyte sedimentation rate (ESR) is a non-specific phenomenon and is clinically useful in the diagnosis and monitoring of disorders associated with an increased production of acute phase reactants. The ESR is increased in pregnancy from about the 3rd month and returns to normal by the 4th week post partum. ESR is influenced by age, sex, menstrual cycle and drugs (eg. corticosteroids, contraceptives). It is especially low (<1mm) in polycythaemia, hypofibrinogenemia or congestive cardiac failure and when there are abnormalities of the red cells such as poikilocytosis, spherocytosis or sickle cells.

Specimen: Blood EDTA

|         |     |               |  |
|---------|-----|---------------|--|
| *Hb A1C | 6.6 | % of Total Hb | Normal : < 5.7 %<br>Pre-Diabetes : 5.7 % - 6.4 %<br>Diabetes : 6.5 % or higher |
|---------|-----|---------------|--|

*Boronate Affinity with Fluorescent Quenching*

|                    |        |       |
|--------------------|--------|-------|
| Mean Blood Glucose | 142.72 | mg/dL |
|--------------------|--------|-------|

*Calculated*
**Degree of Glucose Control Normal Range:**

Poor Control &gt;7.0% \*

Good Control 6.0 - 7.0 %\*\*Non-diabetic level &lt; 6.0 %

\* High risk of developing long term complication such as retinopathy, nephropathy, neuropathy, cardiopathy, etc.

\* Some danger of hypoglycemic reaction in Type I diabetics.

\* Some glucose intolerant individuals and "subclinical" diabetics may demonstrate HbA1c levels in this area.

**EXPLANATION :-**

\*Total haemoglobin A1 c is continuously synthesised in the red blood cell through its 120 days life span. The concentration of HBA1c in the cell reflects the average blood glucose concentration it encounters.

\*The level of HBA1c increases proportionately in patients with uncontrolled diabetes. It reflects the average blood glucose concentration over an extended time period and remains unaffected by short-term fluctuations in blood glucose levels.

\*The measurement of HbA1c can serve as a convenient test for evaluating the adequacy of diabetic control and in preventing various diabetic complications. Because the average half life of a red blood cell is sixty days, HbA1c has been accepted as a measurement which reflects the mean daily blood glucose concentration, better than fasting blood glucose determination, and the degree of carbohydrate imbalance over the preceding two months.

\*It may also provide a better index of control of the diabetic patient without resorting to glucose loading procedures.

**HbA1c assay Interferences:**

\*Erroneous values might be obtained from samples with abnormally elevated quantities of other Haemoglobins as a result of either their simultaneous elution with HbA1c(HbF) or differences in their glycation from that of HbA(HbS)

**IMMUNOLOGY**
**THYROID FUNCTION TEST**

|   |      |       |             |
|---|------|-------|-------------|
| <b>T3 (Triiodothyronine)</b><br><i>CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY</i> | 0.96 | ng/mL | 0.86 - 1.92 |
|---|------|-------|-------------|

Triiodothyronine (T3) is a hormone synthesized and secreted by the thyroid gland in response to the pituitary hormone TSH (thyroid stimulating hormone) and is regulated by a negative feedback mechanism involving the thyroid gland, pituitary gland and hypothalamus.

In the circulation, 99.7% of T3 is reversibly bond to transport proteins, primarily thyroxine-binding globulin (TBG) and to a lesser extent albumin and prealbumin. The remaining unbound T3 is free in the circulation and is metabolically active.

In hypothyroidism and hyperthyroidism, F T3 (free T3) levels parallel changes in total T3 levels. Measuring F T3 is useful in certain conditions such as normal pregnancy and steroid therapy, when altered levels of total T3 occur due to changes in T3 binding proteins, especially TBG.

|   |       |       |            |
|---|-------|-------|------------|
| <b>T4 (Thyroxine)</b><br><i>CHEMILUMINECENT MICROPARTICLE IMMUNOASSAY</i> | 11.10 | µg/dL | 3.2 - 12.6 |
|---|-------|-------|------------|

Thyroxin (T4) is a hormone synthesized and secreted by the thyroid gland in response to the pituitary hormone TSH (thyroid stimulating hormone) and is regulated by a negative feedback mechanism involving the thyroid gland, pituitary gland and hypothalamus. In the circulation, 99.95% of T4 is reversibly bond to transport proteins, primarily thyroxine-binding globulin (TBG) and to a lesser extent albumin and thyroxine-binding prealbumin. The remaining unbound T4 is free in the circulation and is both metabolically active and a precursor to triiodothyronine (T3).

In hypothyroidism and hyperthyroidism, F T4 (free T4) levels parallel changes in total T4 levels. Measuring FT4 is useful in certain conditions such as normal pregnancy and steroid therapy, when altered levels of total T4 occur due to changes in T4 binding proteins, especially TBG.

**Limitations:**

1. The anticonvulsant drug phenytoin may interfere with total and F T4 levels due to competition for TBG binding sites.
2. F T4 values may be decreased in patients taking carbamazepine.
3. Thyroid autoantibodies in human serum may interfere and cause falsely elevated F T4 results.

**TSH** 1.930  $\mu$ IU/ml 0.35 - 5.50  
*CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY*

Thyroid stimulating hormone (TSH) is synthesized and secreted by the anterior pituitary in response to a negative feedback mechanism involving concentrations of FT3 (free T3) and FT4 (free T4). Additionally, the hypothalamic tripeptide, thyrotropin-releasing hormone (TRH), directly stimulates TSH production. TSH stimulates thyroid cell production and hypertrophy, also stimulate the thyroid gland to synthesize and secrete T3 and T4. Quantification of TSH is significant to differentiate primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low.

TSH levels During Pregnancy :

First Trimester : 0.1 to 2.5  $\mu$ IU/mL

Second Trimester : 0.2 to 3.0  $\mu$ IU/mL

Third trimester : 0.3 to 3.0  $\mu$ IU/mL

**IMMUNOLOGY**

|   |      |       |       |
|---|------|-------|-------|
| <b>TOTAL PROSTATE SPECIFIC ANTIGEN (PSA)</b><br><small>CMIA</small> | 0.48 | ng/mL | 0 - 4 |
|---|------|-------|-------|

Measurement of total PSA alone may not clearly distinguish between benign prostatic hyperplasia (BPH) from cancer, this is especially true for the total PSA values between 4-8 ng/mL.

Percentage of free PSA = free PSA/total PSA X 100

Percentage of free PSA: Patients with prostate cancer generally have a lower percentage of Free PSA than patients with benign prostatic hyperplasia. Percentage Free PSA of less than 25% is a high likelihood of prostatic cancer.

**X RAY CHEST PA**

Both lung fields appear clear.

No evidence of any active infiltrations or consolidation.

Cardiac size appears within normal limits.

Both costo-phrenic angles appear free of fluid.

Both domes of diaphragm appear normal.

**COMMENT: No significant abnormality is detected.**

**USG ABDOMEN**

**Liver** appears normal in size & **increased in echogenicity**. No evidence of focal solid or cystic lesion seen. No evidence of dilatation of intra-hepatic biliary or portal radicals. PV is normal in caliber.

**Gall bladder** is normally distended. No evidence of calculus or mass seen. Gall bladder wall thickness appears normal.

**Pancreas** Visualized portion appears normal in size and echopattern. No evidence of focal lesions.

**Spleen** appears normal in size & echopattern. No evidence of focal lesions.

**Both kidneys** are normal in size, shape and position. C.M. differentiation on both sides is maintained. No evidence of hydronephrosis, calculus or solid mass on either side.

**Urinary bladder** is partially distended. No evidence of calculus or mass.

**Prostate** appears normal in size and echopattern. No evidence of focal lesions.

No evidence of free fluid in peritoneal cavity.

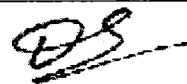

No evidence of para-aortic lymph adenopathy.

No evidence of dilated small bowel loops.

**COMMENTS:**

**Grade I fatty liver.**
