HbA1C (HPLC Method)

Glycated Haemoglobin (HbA1C), by HPLC	: 5.7	%	4.5 - 6.5
Estimated Average Glucose (eAG)	: 116	mg/dL	

Interpretation :

HbA1C level reflects the mean glucose concentration over previous 8-12 weeks and provides better indication of long term glyceimic control.

For diagnosis of Diabetes Mellitus (>= 18 yrs of age) :

5.7 % - 6.4 % : Increased risk for developing diabetes.

>= 6.5 % : Diabetes

Therapeutic goals for glyceimic control :

Adults : < 7%

Toddlers and Preschoolers : < 8.5% (but > 7.5 %)

School age (6-12 yrs) : < 8%

Adolescents and young adults (13 - 19 yrs) : < 7.5 %

The A1c target should be individualized based on numerous factors, such as age, life expectancy, comorbid conditions, duration of diabetes, risk of hypoglycemia or adverse consequences from hypoglycemia, patient motivation and adherence.

Levels of HbA1C may be low as result of shortened RBC life span in case of hemolytic anemia.

Increased HbA1C values may be found in patients with polycythemia or post splenectomy patients.

In patients with Homozygous forms of rare variant Hb(CC,SS,EE,SC), HbA1c cannot be quantitated as there is no HbA. In such circumstances glyceimic control needs to be monitored using alternative methods like plasma glucose levels or serum Fructosamine.

Estimated Average Glucose (eAG) :

1. eAG is an estimated average of blood glucose level over previous 8-12 weeks.

2. HbA1C and eAG have a linear relationship.

3. The eAG is not a substitute for fasting and post prandial blood sugar measurements as prescribed by your physician or home blood glucose monitoring.

ENDOCRINOLOGY

TFT (THYROID FUNCTION TEST)

T3-Total (Tri iodothyronine)	: 1.29	ng/mL	0.970 - 1.69
T4 - Total (Thyroxin)	: 7.08	µg/dL	5.53 - 11.0
Thyroid Stimulating Hormones (Ultra TSH)	: 6.03	µIU/mL	0.465 - 4.68

NOTE:-

Three common ways in which there may be inadequate amounts of the thyroid hormone for normal metabolism. Primary hypothyroidism, in which there is a raised TSH & a low T3. This is due to failure of the thyroid gland, possibly due to autoantibody disease, possibly due to toxic stress or possibly due to iodine deficiency. The second, the most common cause of thyroid failure, occurs at the pituitary level. In this condition there is inadequate thyroid stimulating hormone (TSH) produced from the pituitary and so one tends to see low or normal TSH, low T4s and variable T3s. This condition is most common in many patients with chronic fatigue syndrome, where there is a general suppression of the hypothalamic-pituitary-adrenal axis. The third type of under-functioning is due to poor conversion of there are normal or possibly slightly raised levels of TSH, normal levels of T4 but low levels of thyroid problem routinely TSH, a Free T4 and a Free T3 are also advisable. Any patients who are taking T3 as part of their thyroid supplement need have their T3 levels monitored as well as T4. T3 is much more quickly metabolized than T4 and blood tests should be done between 4-6 hours after their morning dose.

The Guideline for pregnancy reference ranges for total T3, T4, Ultra TSH Level in pregnancy

	Total T3	Total T4	Ultra TSH
First Trimester	0.86 - 1.87	6.60 - 12.4	0.30 - 4.50
