**BIOCHEMISTRY**

Test	Specimen	Result	Units	Reference Range
# Prostate Specific Antigen (PSA), Total, <b>TPSA</b>	Blood, Serum	0.63	ng / ml	< 4.00

**COMMENTS:**

Prostate specific antigen (PSA) is a protein produced primarily by cells in the prostate, a small gland in males that encircles the urethra and produces a fluid that makes up part of semen. Most of the PSA that the prostate produces is released into this fluid, but small amounts of it are also released into the blood. PSA exists in two main forms in the blood: complexed (cPSA, bound to other proteins) and free (fPSA, not bound). The most frequently used PSA test is the total PSA, which measures the sum of cPSA and fPSA in the blood.

The PSA test may be used as a tumor marker to screen for and to monitor prostate cancer. The goal of screening is to detect prostate cancer while it is still confined to the prostate. However, most experts agree that screening should be done on asymptomatic men only after thorough discussions with their healthcare practitioners on the benefits and risks and after informed decisions are made to undergo screening. Elevated blood levels of PSA are associated with prostate cancer, but they may also be seen with inflammation of the prostate (prostatitis) and benign prostatic hyperplasia (BPH). PSA levels tend to increase in all men as they age, and men of African American heritage may have levels that are higher than other men, even at earlier ages.

**% Probability of detecting Prostate cancer on a needle biopsy:**

Free : total PSA ratio	50 – 59 years	60 – 69 years	70 years and older
< = 0.10	49%	58%	65%
0.11 – 0.18	27%	34%	41%
0.19 – 0.25	18%	24%	30%
> 0.25	9%	12%	16%
