INTERPRETATION

- 1) Human hemoglobin inside erythrocytes undergoes a non enzymatic chemical reaction with glucose. The rate & extent of this reaction are thought to be dependent on the average blood glucose.
- 2) The ratio of HbA1c to the total HbA concentration has been suggested as a reliable measure of the degree of metabolic control in diabetic patients.
- 3) Lipemic and Icteric samples do not interfere with the measurement of the percent HbA1c.
- 4) Hemoglobin F (Hb F) has the potential to interfere with the measurement of HbA1c generating falsely elevated % Alc values average blood glucose.

PROSTATE SPECIFIC ANTIGEN (PSA)

PROSTATE SPECIFIC ANTIGEN (PSA) 1.79 ng/ml <3.5

Interpretation : Prostate-specific antigen (PSA) is a glycoprotein that is produced by the prostate gland, the lining of the urethra, and the bulbourethral gland. PSA exists in serum mainly in two forms, complexed to alpha-1 -anti -chymotrypsin (PSA-ACT complex) and unbound (free PSA). Increases in prostatic glandular size and tissue damage caused by benign prostatic hypertrophy, prostatitis, or prostate cancer may increase circulating PSA levels. Transient increase in PSA can also be seen following per rectal digital or sonological examinations
