Note:

- 1.The diagnosis of Diabetes requires a fasting plasma glucose of > or = 126 mg/dL and/or a random / 2 hr post glucose value of > or = 200 mg/dL on at least 2 occasions.
2. Very high glucose levels (>450 mg/dL in adults) may result in Diabetic Ketoacidosis & is considered critical.

| GLUCOSE, POST PRANDIAL (PP), 2 HOURS , SODIUM FLUORIDE PLASMA (2 HR) | 112 | mg/dL | 70-140 | HEXOKINASE |

Comment:

It is recommended that FBS and PPBS should be interpreted with respect to their Biological reference ranges and not with each other.
Conditions which may lead to lower postprandial glucose levels as compared to fasting glucose levels may be due to reactive hypoglycemia, dietary meal content, duration or timing of sampling after food digestion and absorption, medications such as insulin preparations, sulfonylureas, amylin analogues, or conditions such as overproduction of insulin.

| ALANINE AMINOTRANSFERASE (ALT/SGPT) , SERUM | 26.32 | U/L | <50 | IFCC |

Comment:

ALT elevations are noted in liver parenchymal diseases, leading to injury / destruction of hepatocytes.
ALT levels are seen to be elevated even before the signs and symptoms of the liver injury appear.
The ALT levels remain high longer in blood as compared to AST levels. And though both the enzymes increase in liver injury, the rise in ALT is more compared to AST, thus also altering the ALT:AST ratio.

|-------------------------------|--------|-------|-----------------|------------|
| GLUCOSE, FASTING , NAF PLASMA | 90 | mg/dL | 70-100 | HEXOKINASE |

Comment:

As per American Diabetes Guidelines, 2023

| Fasting Glucose Values in mg/dL | Interpretation |
|---------------------------------|----------------|
| 70-100 mg/dL | Normal |
| 100-125 mg/dL | Prediabetes |
| ≥126 mg/dL | Diabetes |
| <70 mg/dL | Hypoglycemia |

Note:

- The diagnosis of Diabetes requires a fasting plasma glucose of $>$ or $=$ 126 mg/dL and/or a random / 2 hr post glucose value of $>$ or $=$ 200 mg/dL on at least 2 occasions.
- Very high glucose levels ($>$ 450 mg/dL in adults) may result in Diabetic Ketoacidosis & is considered critical.

Comment:

ALT elevations are noted in liver parenchymal diseases, leading to injury / destruction of hepatocytes. ALT levels are seen to be elevated even before the signs and symptoms of the liver injury appear. The ALT levels remain high longer in blood as compared to AST levels. And though both the enzymes increase in liver injury, the rise in ALT is more compared to AST, thus also altering the ALT:AST ratio.

It is recommended that FBS and PPBS should be interpreted with respect to their Biological reference ranges and not with each other.

Conditions which may lead to lower postprandial glucose levels as compared to fasting glucose levels may be due to reactive hypoglycemia, dietary meal content, duration or timing of sampling after food digestion and absorption, medications such as insulin preparations, sulfonylureas, amylin analogues, or conditions such as overproduction of insulin.
