CLINICAL BIOCHEMISTRY

TEST DESCRIPTION	RESULT	UNITS	BIOLOGICAL REFERENCE RANGE
GLYCOSYLATED HEMOGLOBIN (HbA1c) <small>(Method: Ion-exchange high-performance liquid chromatography(HPLC))</small>			
HBA1c	5.2	%	4-6% : Non Diabetic 6-7 %: Excellent Control 7-8 % : Fair and Control 8-10%: Unsatisfactory Control Above 10% Poor Control
estimated Average Glucose (eAG)	138	mg/dL	70-160

Interpretation(s)

NOTE:

- Glycosylated hemoglobin (HbA1c) test is done to assess compliance with therapeutic regimen in diabetic patients.
- A three monthly monitoring is recommended in clinical management of diabetes.
- It is not affected by daily glucose fluctuations, exercise and recent food intake.
- The HbA1c is linearly related to the average blood sugar over the past 1-3 months (but is heavily weighted to the past 2-4 weeks).
- The HbA1c is strongly associated with the risk of development and progression of microvascular and nerve complications
- High HbA1c (>9.0-9.5%) is associated with very rapid progression of microvascular complications
- Any condition that shorten RBC life span like acute blood loss, hemolytic anemia falsely lower HbA1c results.
- HbA1c results from patients with HbSS, HbCC, HbSC and HbD must be interpreted with caution, given the pathological processes including anemia, increased red cell turnover, and transfusion requirements that adversely impact HbA1c as a marker of long-term glycemic control.
- Specimens from patients with polycythemia or post-splenectomy may exhibit increase in HbA1c values due to a somewhat longer life span of the red cell.
