The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data.

In the second section, the author outlines the various methods used to collect and analyze the data. This includes both primary and secondary data collection techniques. The primary data was gathered through direct observation and interviews with key stakeholders.

The analysis phase involved using statistical software to identify trends and correlations within the data set. The results show a clear upward trend in the number of transactions over the period studied.

Finally, the document concludes with a series of recommendations for improving the current system. These include implementing more robust security measures and enhancing the user interface to make data entry more efficient.

| ESTIMATED AVERAGE GLUCOSE | 120 | mg/dL | | |

Note : Any condition altering red cell life will alter the GHB values. Low Hb% values may not correlate with GHB. GHB value should not be taken as a sole criteria for diagnosis. GHB gives average Blood Glucose level for the period of 10 - 12 wks & it need not correlate with blood sugar levels. For Geriatric group, HbA1c reference range depends upon comorbid conditions.
