

MER- MEDICAL EXAMINATION REPORT

Date of Examination	25/10/24		
NAME	ANIL KUMAR		
AGE	33	Gender	M
HEIGHT(cm)	165	WEIGHT (kg)	84
B.P.	116/70		
ECG	Normal		
X Ray	Normal		
Vision Checkup	Not using lens glasses.		
Present Ailments	None		
Details of Past ailments (If Any)	None		
Comments / Advice : She /He is Physically Fit	Mentally fit		

Signature with Stamp of Medical Examiner

Dr. Smita Prasad
MBBS, DCH

LIPID PROFILE

Triglycerids	151	mg%	70 - 190
S. Cholestrol S.	215	mg%	130 - 230
S. HDL Cholestrol	46.2	mg%	35 - 75
S. LDL Cholestrol	138.6	mg%	75 - 150
VLDL	30.2	mg%	0 - 34
Chol / HDL factor	4.65		
LDL / HDL Factor	3		

COMMENTS

- * Triglycerides (TG) are the main dietary lipids. Cholesterol constitutes a small part of the dietary lipids, it is mostly synthesised in the liver. Both TG and Chol. are transported through the plasma by lipoproteins (Chylomicrons, VLDL, LDL, IDL, HDL).
- * LDL is the major cholesterol particle in plasma and high levels are strongly implicated in the formation of atheroma. An increase in the LDL leads to hypercholesterolemia, and therefore a risk factor for IHD. LDL increases with age particularly in females. Oestrogen lower LDL and raise HDL. Raised chol. in females is mostly due to disturbed thyroid function.
- * Increase in VLDL leads to hyperglyceridaemia. Raised TGs are associated with increased risk of CHD. Very high TGs increase the risk of Pancreatitis. Cholesterol is often raised due to Diabetes, Renal disease, Diuretic or Betablocker therapy.

TYPES OF HYPERLIPOPROTEINEMIAS

TYPE 1: Normal cholesterol TG greatly raised	TYPE 3: Cholesterol increased TG increased
TYPE 2a: Cholesterol increased LDL increased TG normal	TYPE 4: Cholesterol normal /increased VLDL increased TG increased
TYPE 2b Chol. increased VLDL raised TG increased LDL increased	TYPE 5: Cholesterol increased LDL reduced VLDL increased TG greatly increased

Thyroid Stimulating Hormone

TSH CLIA	2.13	miU/ml	0.3 to 6.0
=====			
COMMENTS AND INTERPRETATION			
=====			
<p>* Ultra sensitive fourth generation is more reliable to assure that the TSH is actually < 0.1 mIU/L.</p> <p>Subnormal TSH : Suggests Hyperthyroidism</p> <p>Elevated TSH : Suggests Hypothyroidism</p> <p>Raised TSH and normal FT4/FT3: Subclinical hypothyroidism or in elderly</p> <p>Transiently decreased TSH ; "Sick Euthyroid Syndrome" seen the hospitalized patients receiving treatment with corticosteroid or Dopamine</p> <p>* Asian women are at a greater risk of Gestational Thyrotoxicosis specially in the 15 to 16 weeks of pregnancy</p> <p>* TSH is more sensitive in than FT4 in detecting changes in the thyroid function because the pituitary gland through negative feed back regulation, is a sensitive bioindicator of the thyroid function. Small changes in the Ft4 concentrations can cause large changes in the TSH levels.</p> <p>* Elevated TSH levels may also be indicative of rare TSH secreting Pituitary Tumour giving rise to Secendory Hyperthyroidism.</p>

Glycosylated Haemoglobin

Glycosylated Haemoglobin	5.2	%	4.5 TO 6.0
=====			
INTERPRETATION AND COMMENTS			
=====			
NON DIABETIC :	4.5 to 6.0 %		
GOOD CONTROL:	6.0 to 7.0		
FAIR CONTROLLED	7.0 AND 8.0		
UNCONTROLLED	8.0 AND ABOVE		
<p>Glycosylated haemoglobin is the adducted glucose in the haemoglobin of the red blood cells, this adduction is stable for the life time of the RBC (i.e 120 days). There fore the measure of glycosylated haemoglobin reflects the average blood glucose concentration over the preseding several weeks. The sudden change in blood glucose level would not effect the glycosylated haemoglobin level , which serves as a better marker of long term metabolic control and the efficacy of therapy.</p>
