PROSTATE SPECIFIC ANTIGEN (TOTAL) - PSA , SERUM

Total PSA	0.37	ng/ml	0.0-4.0	CLIA
-----------	------	-------	---------	------

NOTE :-

P.S.A is a highly specific for prostate tissue and may be increased in prostate cancer, benign prostate hyperplasia (BPH) and prostatitis. At present a cut off 4.1 ng/ml is used for prostate cancer screening.

PSA values greater than 10.0 ng/ml are highly predictive of cancer.

PSA levels by itself can not be used to determine whether a patient has Prostate cancer confined to the organ.

Determination of Free PSA along with total PSA is useful in the differentiation of Prostate cancer from benign condition.

After radical prostatectomy, serum PSA levels are (< 0.2 ng/ml), 93% of patients with undetectable serum PSA concentration have no clinical tumour recurrence.

Comments:-

1. False negative / positive results are observed in patients receiving mouse monoclonal antibodies for diagnosis or therapy.
- 2.PSA total and free levels may appear consistently elevated/ depressed due to the interference by heterophilic antibodies and nonspecific protein binding.
- 3.Results obtained with different assay kits cannot be used interchangeably.
- 4.All results should be correlated with clinical findings and result of other investigations.

COMMENT :- Above mentioned reference ranges are standard reference ranges.

AGE RELATED GUIDELINES FOR REFERENCE RANGES FOR TSH

TSH	NEW BORN	INFANT	CHILD	ADULT
(u IU/ml)	0.52-38.9	1.7-9.1	0.7-6.4	0.3-5.6

PREGNANCY RELATED GUIDELINES FOR REFERENCE RANGES FOR TSH

TSH	1st Trimester	2nd & 3rd Trimester
(u IU/ml)	0.2 - 2.5	0.3 - 3.0

NOTE: TSH levels are subject to circadian variation, reaching peak levels between 2-4 AM and at a minimum between 6-10 PM. Dose and time of drug intake also influence the test result.

Ultrasensitive kits used.

Serum T3/ FT3 , T4/FT4 and TSH measurements form three components of thyroid screening panel.

- Primary hyperthyroidism is accompanied by elevated serum T3 & T4 values alongwith depressed TSH level.
- Primary hypothyroidism is accompanied by elevated serum T3 & T4 values & elevated serum TSH level.
- Normal T3 & T4 levels with high TSH indicate mild / subclinical HYPOTHYROIDISM.
- slightly elevated T3 levels may be found in pregnancy and in estrogen therapy while depressed levels may be encountered in severe illness, malnutrition, renal failure and during therapy with drugs like propranolol.
- Although elevated TSH levels are nearly always indicative of primary hypothyroidism. Rarely they can result from TSH secreting pituitary tumours (secondary hyperthyroidism).
