ESR	10	< 20 mm at the end of 1Hr.	WESTERGREN
<p><b>INTERPRETATION</b>  <b>ESR(Erythrocyte Sedimentation Rate)</b>-The ESR measures the time required for erythrocytes from a whole blood sample to settle to the bottom of a vertical tube. Factors influencing the ESR include red cell volume, surface area, density, aggregation, and surface charge. The ESR is a sensitive, but nonspecific test that is frequently the earliest indicator of disease. It often rises significantly in widespread inflammatory disorders due to infection or autoimmune mechanisms. Such elevations may be prolonged in localized inflammation and malignancies.  <b>Increased ESR:</b> may indicate pregnancy, acute or chronic inflammation, tuberculosis, rheumatic fever, paraproteinemias, rheumatoid arthritis, some malignancies, or anemia.  <b>Decreased ESR:</b> may indicate polycythemia, sickle cell anemia, hyperviscosity, or low plasma proteins.</p>

## REPORT

### Biochemistry

Test Name	Result	Unit	Biological Reference Interval
HbA1c (Glycylated Haemoglobin) WB-EDTA	5.6	%	Normal <5.7 % Pre Diabetic 5.7 - 6.4 % Diabetic >6.5 % Target for Diabetes on therapy < 7.0 % Re-evaluation of therapy > 8.0 % Reference ADA Diabetic Guidelines 2013.

Method : HPLC (High Performance Liquid Chromatography)

Mean Blood Glucose 114.0 mg/dL

Method : Calculated

#### Corelation of A1C with average glucose

A1C (%)	Mean Blood Glucose (mg/dl)
6	126
7	154
8	183
9	212
10	240
11	269
12	298

#### Interpretation :

1.The HbA1c levels corelate with the mean glucose concentration prevailing in the course of Pts recent history (apprx 6-8 weeks) & therefore provides much more reliable information for glycemia control than the blood glucose or urinary glucose. This Methodology is better then the routine chromatographic methods & also for the daibetic pts.having HEMOGLBINOPATHIES OR UREMIA as Hb varaints and uremia does not INTERFERE with the results in this methodology.

2.It is recommended that HbA1c levels be performed at 4 - 8 weeks during therapy in uncontrolled DM pts.& every 3 - 4 months in well controlled daibetics.

3.Mean blood glucose (MBG) in first 30 days ( 0-30 )before sampling for HbA1c contributes 50% whereas MBG in 90 - 120 days contribute to 10% in final HbA1c levels

**PORTAL VEIN:** portal vein appears normal.

**GALL BLADDER:** The gall bladder is well distended. There is no evidence of calculus, wall thickening or pericholecystic collection.

**COMMON BILE DUCT:** The visualised common bile duct is normal in caliber. No evidence of calculus is seen in the common bile duct. Terminal common bile duct is obscured due to bowel gas artifacts.

**PANCREAS:** The head and part of body of pancreas is normal in size, shape, contours and echo texture. Rest of the pancreas is obscured due to bowel gas artifacts.

**SPLEEN:** The spleen is normal in size and shape. Its echotexture is homogeneous.

**KIDNEYS:**

Right kidney	Left kidney
9.4 x 4.8 cm	11.6 x 5.6 cm

The kidneys are normal in size and have smooth renal margins. Cortical echotexture is normal. The central echo complex does not show evidence of hydronephrosis. No evidence of hydroureter or calculi, bilaterally.
