MAMMOGRAPHY

Both breasts are heterogeneously dense (*Breast composition type C*) with moderate sensitivity.

No e/o micro / macro calcification in both breasts.

Skin and subcutaneous planes are normal.

Axillary tail and retromammary regions appear normal.

No obvious e/o Axillary lymphadenopathy.

IMPRESSION:

• Essentially normal study.

BIRADS CATEGORY – 1 (NEGATIVE)

- For clinical correlation.

BIRADS –I	Negative	Routine screening recommended
BIRADS –II	Benign finding	Routine screening recommended
BIRADS –III	Probably benign, probability of malignancy < 2%	Short term interval follow up x 6 months recommended to assess stability
BIRADS –IV	Suspicious abnormality, probability of malignancy 3 -94% A. Low suspicious for malignancy B. Intermediate probability for malignancy C. Moderate concern for malignancy	Recommended biopsy.
BIRADS –V	Highly suggestive of malignancy > = 95%	Recommended biopsy intervention required

INTERPRETATION:

Factors such as type, quantity and time of food intake, Physical activity, Psychological stress, and drugs can influence blood glucose level. Fasting blood glucose level may be higher than Postprandial glucose, because of physiological surge in Postprandial Insulin secretion, Insulin resistance, Exercise or Stress, Dawn Phenomenon, Somogyi Phenomenon, Anti- diabetic medication during treatment for Diabetes.

Triglycerides (Serum/Glycerol-phosphate oxidase/Peroxidase)	126	mg/dL	Optimal: < 150 Borderline: 150 - 199 High: 200 - 499 Very High: >= 500

INTERPRETATION: The reference ranges are based on fasting condition. Triglyceride levels change drastically in response to food, increasing as much as 5 to 10 times the fasting levels, just a few hours after eating. Fasting triglyceride levels show considerable diurnal variation too. There is evidence recommending triglycerides estimation in non-fasting condition for evaluating the risk of heart disease and screening for metabolic syndrome, as non-fasting sample is more representative of the `usual_ circulating level of triglycerides during most part of the day.

INTERPRETATION: 1.Non-HDL Cholesterol is now proven to be a better cardiovascular risk marker than LDL Cholesterol. 2.It is the sum of all potentially atherogenic proteins including LDL, IDL, VLDL and chylomicrons and it is the "new bad cholesterol" and is a co-primary target for cholesterol lowering therapy.

INTERPRETATION: Comments HbA1c provides an index of Average Blood Glucose levels over the past 8 - 12 weeks and is a much better indicator of long term glycemic control as compared to blood and urinary glucose determinations. Conditions that prolong RBC life span like Iron deficiency anemia, Vitamin B12 & Folate deficiency, hypertriglyceridemia,hyperbilirubinemia,Drugs, Alcohol, Lead Poisoning, Asplenia can give falsely elevated HbA1C values. Conditions that shorten RBC survival like acute or chronic blood loss, hemolytic anemia, Hemoglobinopathies, Splenomegaly,Vitamin E ingestion, Pregnancy, End stage Renal disease can cause falsely low HbA1c.

INTERPRETATION: Reference range for cord blood - upto 20 1 st trimester: 0.1-2.5 2 nd trimester 0.2-3.0 3 rd trimester : 0.3-3.0 (Indian Thyroid Society Guidelines) Comment : 1.TSH reference range during pregnancy depends on Iodine intake, TPO status, Serum HCG concentration, race, Ethnicity and BMI. 2.TSH Levels are subject to circadian variation, reaching peak levels between 2-4am and at a minimum between 6-10PM.The variation can be of the order of 50%,hence time of the day has influence on the measured serum TSH concentrations. 3.Values&lt0.03 μIU/mL need to be clinically correlated due to presence of rare TSH variant in some individuals.
