REPORT :-

LIVER :-

Liver is marginally enlarged in size (15.6 cm), echotexture is normal. The Intrahepatic tubular structures are normal. No focal area of altered echogenicity is noted. The porta hepatitis is normal. The common bile duct at porta measures 0.4 cm. in diameter. The portal vein measures 1.0 cm. at porta.

GALL BLADDER :-

Gall bladder is distended. Wall is normal. No calculus or mass is seen within the gall bladder.

PANCREAS :- It is normal in size, shape, outline and echotexture. Pancreatic duct is not dilated

SPLEEN :-It is normal in size (7.4 cm), shape, outline and echotexture. No parenchymal lesion is noted.

BOTH KIDNEYS :-

Both the kidneys are normal in position, size, shape, outline and echotexture. The cortico medullary differentiation is maintained. No calculus or hydronephrosis is seen. Right kidney measures 11.3 cm & Left kidney measures 11.0 cm

URETER :-

Ureter is not visualised

URINARY BLADDER:-

Bladder is well distended with normal wall thickness. No calculus or mass is seen within the urinary bladder. The post void residual volume of urine is insignificant.

PROSTATE :-

Prostate is normal in size. It has a homogenous echotexture. The prostatic outline is smooth. Periprostatic plane is normal. It measures 3.7 x 3.6 x 2.9 cm. & weighs 20 gms. approx.

DEPARTMENT OF LABORATORY MEDICINE

TEST NAME	RESULT	BIOLOGICAL REFERENCE INTERVALS	UNITS
GLUCOSE- (FASTING) Method: (GOD-POD)	87.4	70.0- 110.0	mg/dl

This measures your blood sugar after an overnight fast (not eating). A fasting blood sugar level of 99 mg/dL or lower is normal, 100 to 125 mg/dL indicates you have prediabetes, and 126 mg/dL or higher indicates you have diabetes. It is your body's main source of energy. A hormone called insulin helps move glucose from your bloodstream into your cells.

GLUCOSE- (POST PRANDIAL) Method: (GOD-POD)	118.0	80.0- 140.0	mg/dl
---	-------	-------------	-------

This is a blood test to check for diabetes. If you have diabetes, your body doesn't make enough insulin to keep your blood sugar in check. This means your blood sugar levels are too high, and over time this can lead to serious health problems including heart, nerve, kidney, and eye damage. Postprandial means after a meal. This test is done to see how your body responds to sugar and starch after you eat a meal. As you digest the food in your stomach, blood glucose, or blood sugar, levels rise sharply. In response, your pancreas releases insulin to help move these sugars from the blood into the cells of muscles and other tissues to be used for fuel. Within two hours of eating, your insulin and blood glucose levels should return to normal. If your blood glucose levels remain high, you may have diabetes.

Test Name	Value	Unit	Normal Range
Glycosylated Haemoglobin (HbA1c), HPLC	5.9%		Excellent Control: <4 Good Control: 4-6 Fair Control: >6-7 Action Suggested: >7-8 Poor Control: >8
Methodology: HPLC Instrument Used: Bio-Rad D-10

Comment

- For patients with Hb variant diseases there may be lowering of HbA1c due to low HbA synthesis.
- EAG is value calculated from HbA1c & indicates average glucose level over past three months.

Factors that interfere with HbA1c Measurement: Genetic variants (e.g. Hbs trait, HbC trait), elevated fetal hemoglobin (HbF) and chemically modified derivatives of hemoglobin (e.g. carbamylated Hb in patients with renal failure) can affect the accuracy of HbA1c measurements. The effects vary depending on the specific Hb variant or derivative and the specific HbA1c method.

Factors that affect interpretation of HbA1c Results: Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g. recovery from acute blood loss, hemolytic anemia) will falsely lower HbA1c test results regardless of the assay method used.

TOTAL T4: THYROXINE – SERUM Method: CLIA	9.34	8.09 – 14.03	μg/Dl

Comment:

Note :->1. TSH levels are subject to circadian variation, reaching peak levels between 2 - 4.a.m. and at a minimum between 6-10 pm . The variation is of the order of 50% , hence time of the day has influence on the measured serum TSH concentrations

> 2. Values <0.03 μIU/mL need to be clinically correlated due to presence of a rare TSH variant in some individuals.

Clinical Use:-> Primary Hypothyroidism > Hyperthyroidism > Hypothalamic – Pituitary hypothyroidism

> Inappropriate TSH secretion > Nonthyroidal illness > Autoimmune thyroid disease

>Pregnancy associated thyroid disorders > Thyroid dysfunction in infancy and early childhood.

Results are to be correlate clinically .
