NEAR ADD : _____ N₆ @ 40CM

Dr. L. A. Shukla (M. S. Opthal)

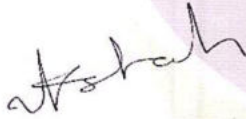

Stamp and Sign

Name :- Ashra funnisha ansari Date:11/02/2023
Age:- 35

X-RAY : CHEST PA

Both lung fields appears normal
There is no evidence of pulmonary tuberculosis
No evidence of pleural Effusion on either side.
Heart size appears normal.
Bony thorax and diaphragms appear normal.

Comment: Normal X-ray chest (PA) view

| Recovery(3) | 0 : 24 | 1.0 | 0 | 0 | 85 | 126 / 78 | -0.42 aVr | 0.64 II |

Interpretation

Normal Haemodynamic Response.
 Normal Chronotropic Response.
 Moderate Exercise Tolerance.
 Normal HR and BP Response.
 No Angina. No Arrhythmias.
 No ST-T changes present in exercise & Recovery.
 Test Negative For Exercise Inducible Ischemia.

THYROID FUNCTIONS

| <u>TEST</u> | <u>RESULT</u> | <u>UNIT</u> | <u>NORMAL VALUE</u> |
|---------------|---------------|-------------|-----------------------|
| Serum T3 : | 0.69 | ng/dl | 0.6 - 1.80 ng/dl |
| Serum T4 : | 5.9 | microgm/dl | 4.5 - 10.9 microgm/dl |
| Serum T.S.H : | 2.810 | microU/ml | 0.35 - 5.55 microU/ml |

COMMENTS :

TSH levels may be affected by acute illness and drugs like doapamine and gluco corticoids.
Low or undetectable TSH is suggestive of Grave~s disease
TSH between 5.5 to 15.0 with normal T3 T4 indicates impaired thyroid hormone or subclinical hypothyroidism or normal T3 T4 with slightly low TSH suggests subclinical Hyperthyroidism.
TSH suppression does not reflect severity of hyperthyroidism therefore , measurement of FT3 ,FT4 is important.
FreeT3 is first hormone to increase in early Hyperthyroidism.
Only TSH level can prove to be misleading in patients on treatment. Therefore FreeT3 , FreeT4 along with TSH should be checked.
During pregnancy clinically T3 T4 can be high and TSH can be slightly low

Glycosylated HB - (HBA1C)

| <u>Test</u> | <u>Result</u> | <u>Unit</u> | <u>Biological Ref Interval</u> |
|--|---------------|--------------|--|
| HBA1C: (Immunoturbidimetric) | 4.71 | % | Normal : ≤ 5.6 Prediabetes : 5.7 - 6.4 Diabetes : ≥ 6.5 <u>DIABETES CONTROL CRITERIA</u> 6 - 7 : Near Normal Glycemia < 7 : Goal 7 - 8 : Good Control > 8 : Action Suggested |
| Mean Blood Glucose: | 88.47 | mg/dl | |

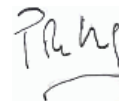

Criteria for the diagnosis of diabetes

- HbA1c ≥ 6.5 *
Or
- Fasting plasma glucose >126 gm/dL. Fasting is defined as no caloric intake at least for 8 hrs.
Or
- Two hour plasma glucose ≥ 200 mg/dL during an oral glucose tolerance test by using a glucose load containing equivalent of 75 gm anhydrous glucose dissolved in water.
Or.
- In a patient with classic symptoms of hyperglycemia or hyperglycemic crisis, a random plasma glucose ≥ 200 mg/dL. *In the absence of unequivocal hyperglycemia, criteria 1-3 should be confirmed by repeat testing. American diabetes association. Standards of medical care in diabetes 2011. Diabetes care 2011;34;S11.

Limitation of HbA1c

- In patients with Hb variants even analytically correct results do not reflect the same level of glycemic control that would be expected in patients with normal population. 2) Any cause of shortened erythrocyte survival or decreased mean erythrocyte survival or decreased mean erythrocyte age eg. hemolytic diseases, pregnancy, significant recent/chronic blood loss etc. will reduce exposure of RBC to glucose with consequent decrease in HbA1c values. 3) Glycated HbF is not detected by this assay and hence specimens containing high HbF ($>10\%$) may result in lower HbA1c values than expected.

BLOOD SUGAR LEVEL

Specimen :

| <u>Test</u> | <u>Result</u> | <u>Unit</u> | <u>Biological Ref. Interval</u> |
|-----------------------------------|---------------|-------------|---------------------------------|
| Fasting Blood Sugar: (GOD-POD) | 81.54 | mg/dl | 70-110 |

American Diabetes Association Reference Range :
Normal : < 100 mg/dl
Impaired fasting glucose(Prediabetes) : 100 - 126 mg/dl
Diabetes : >= 126 mg/dl

Conditions that can result in an elevated blood glucose level include: Acromegaly, Acute stress (response to trauma, heart attack, and stroke for instance), Chronic kidney disease, Cushing syndrome, Excessive consumption of food, Hyperthyroidism, Pancreatitis A low level of glucose may indicate hypoglycemia, a condition characterized by a drop in blood glucose to a level where first it causes nervous system symptoms (sweating, palpitations, hunger, trembling, and anxiety), then begins to affect the brain (causing confusion, hallucinations, blurred vision, and sometimes even coma and death). A low blood glucose level (hypoglycemia) may be seen with: Adrenal insufficiency, Drinking excessive alcohol, Severe liver disease, Hypopituitarism, Hypothyroidism, Severe infections, Severe heart failure, Chronic kidney (renal) failure, Insulin overdose, Tumors that produce insulin (insulinomas), Starvation.
