**Note : Clinical Significance:**

Thyroid function tests (TFTs) is a collective term for blood tests used to check the function of the thyroid. TFTs may be requested if a patient is thought to suffer from hyperthyroidism (overactive thyroid) or hypothyroidism (underactive thyroid), or to monitor the effectiveness of either thyroid-suppression or hormone replacement therapy. It is also requested routinely in conditions linked to thyroid disease, such as atrial fibrillation and anxiety disorder. A TFT panel typically includes thyroid hormones such as thyroid-stimulating hormone (TSH, thyrotropin) and thyroxine (T4), and triiodothyronine (T3) depending on local laboratory policy.

Note: Please correlate with clinical condition

1. The smears are reported using the Bethesda system (2014) for reporting cervical cytology.
2. Cervical cytology is a screening test primarily for squamous cancer and its precursors and has associated false-negative and false-positive results. Technologies such as liquid-based preparations may decrease but will not eliminate all false negative results. Follow-up of unexplained clinical signs and symptoms is recommended to minimize false-negative results.
3. In patients with squamous or glandular intraepithelial abnormalities, further diagnostic follow-up procedures, such as HPV testing, colposcopy / biopsy with endocervical sampling are suggested, as clinically indicated.
