FINDINGS:

- Bilateral lung fields are clear.
- Tracheal shadow is in the midline.
- Bilateral CP angle are clear
- Both hilum appear normal .
- CTR appears normal .
- No definite bone fracture is noted.

ULTRASOUND OF WHOLE ABDOMEN

LIVER: Liver is **Enlarged Moderate fatty changes seen**. The intrahepatic tubular structures are normal.no focal area of altered echogenicity is noted. The porta hepatis is normal. The common bile duct at porta measures **0.41cm** . The portal vein measures **0.91cm** at porta.

GALL BLADDER: : Gall bladder is distended. Wall is normal limits. No calculus or mass is seen within the gall bladder .

PANCREAS: It is normal in size, Shape, Outline and echotexture. Pancreatic duct is not dilated.

SPLEEN: It is normal in size **10.73cm**, Shape, Outline and echotexture. No parenchymal lesion is noted.

RIGHT KIDNEY: kidneys are normal in position, size, shape, outline and echotexture.The cortico medullary differentiation is maintained. No calculus or hydronephrosis is seen.

RIGHT KIDNEY: measures – **8.73cm**.

LEFT KIDNEY: kidneys are normal in position, size, shape, outline and echotexture.The cortico medullary differentiation is maintained. No calculus or hydronephrosis is seen. **Full ness of renal pelvis seen.**

LEFT KIDNEY: measures – **10.34cm**.

URINARY BLADDER: : It is well distended with normal wall thickness. No calculus or mass is seen within the urinary bladder.

PROSTATE: It is normal in size, Shape & homogenous echotexture. The prostatic outline is smooth. The periprostatic plane is normal. It is normal size measures **2.78cmX3.92cmX2.99cm**
Vol= 17.02 ml.

IMPRESSION:

- **HPATOMEGALY WITH MODERATE FATTY CHANGES.**

Instrument Used: Bio-Rad D-10

Comment

- For patients with Hb variant diseases there may be lowering of HbA1c due to low HBA synthesis.
- EAG is value calculated from HbA1c & indicates average glucose level over past three months.

Factors that interfere with HbA1c Measurement: Genetic variants (e.g. HbS trait, HbC trait), elevated fetal hemoglobin (HbF) and chemically modified derivatives of hemoglobin (e.g. carbamylated Hb in patients with renal failure) can affect the accuracy of HbA1c measurements. The effects vary depending on the specific Hb variant or derivative and the specific HbA1c method.

Factors that affect interpretation of HbA1c Results: Any condition that shortens erythrocyte survival or decreases mean erythrocyte age (e.g., recovery from acute blood loss, hemolytic anemia) will falsely lower HbA1c test results regardless of the assay method used.

NOTE: Regarding blood sugar levels, if a patient is diabetic and if He/she is on oral medication for diabetes, the sugar levels can be fasting blood sugar level more than the post prandial blood sugar. This happens because most of the anti-diabetic medications are taken either with or before breakfast. If the patient is not a diabetic, as soon as He/she takes the breakfast, it will act as a stimulant to produce insulin in the body and that will bring down the post prandial blood sugar level (PP). Normal diet can be 2 or 3 doses, chapatis or rotis, in which the blood glucose level will be lower than 75 grams of direct glucose. This direct glucose might also increase the sugar level to 260. Another scenario for increase in sugar after empty stomach will be because of the hormone called glucagon, which will induce glycogenolysis and neoglucogenesis in the body when the sugar levels are very low. In this mechanism, the stored glycogen or lipids will be converted into glucose, thus increasing the blood sugar level.

Interpretation

Lipids are most commonly measured to ass cardiovascular risk. Maintaining desirable concentrations of lipids lowers the risk of heart attacks or strokes. Establishing appropriate treatment strategies and lipid goals require the results for each component of a lipid profile be consider in context with other risk factors including, age, sex, smoking status, family and personal history of heart disease.

Cautions

Fasting overnight (12 hours)

Patient must not consume any alcohol for 24 hours before the specimen is drawn.

Cholesterol levels fluctuate over time. The American Heart Association recommends a minimum of 2 measures at least 2 weeks apart before beginning a new treatment plan.

Triiodothyronine

Triiodothyronine (T3) values >1.8 ng/mL in adults or > age related cutoffs in children are consistent with hyperthyroidism or increased thyroid hormone-binding proteins.

Abnormal levels (high or low) of thyroid hormone-binding proteins (primarily albumin and thyroid-binding globulin) may cause abnormal T3 concentrations in euthyroid patients.

Total Thyroxine

*Values of more than 10.8 mcg/dL in adults or more than the age-related cutoffs in children are seen in hyperthyroidism and patients with acute thyroiditis.

*Values below 4.4 mcg/dL in adults or below the age-related cutoffs in children are seen in hypothyroidism, myxedema, cretinism, chronic thyroiditis, and occasionally, subacute thyroiditis.

*Increased total thyroxine (T4) is seen in pregnancy and patients who are on estrogen medication. These patients have increased total T4 levels (increased thyroxine-binding globulin: TBG levels).

*Decreased total T4 is seen in patients on treatment with anabolic steroids, or nephrosis (decreased TBG levels).

*A thyrotropin-releasing hormone stimulation test may be required for certain cases of hyperthyroidism.

*Clinical findings are necessary to determine if thyroid-stimulating hormone, TBG, or free T4 testing is needed

Reference range during pregnancy

Pregnancy	TSH Level(µIU/ml)
Pregnant Females, 1st Trimester	0.05 to 3.70
Pregnant Females, 2nd Trimester	0.31 to 4.35
Pregnant Females, 3rd Trimester	0.41 to 5.18

Note:

*TSH stimulates the thyroid gland to produce the main thyroid hormones T3 and T4.

- *In case of hyperthyroidism TSH level is severely inhibited and may even be undetectable.
- *In rare forms of high-origin hyperthyroidism, the TSH level is not reduced, since the negative-feedback control of the thyroid hormones has no effect.
- *In case of primary hypothyroidism, TSH level are always much higher than normal and thyroid levels are low.
- *The TSH assay aids in diagnosis thyroid or hypophysial disorder.
- *In pateints with hyperthyroidism, the FT4 concentration increases, whereas in patients with hypothyroidism it generally decreases.
- *Patients on hormone replacement therapy may have an elevation of FT4, although clinically they are euthyroid.
- *FT3 plays an important diagnostic role in hyperthyroidism, Monitoring of patients with hypothyroidism treated with thyroxine and Anti-thyroid agents and low T3 syndrome.
- *The FT3 and FT4 assay must be used in conjunction with other tests such as TSH as well as a clinical examination of the patient.
