**HEMOGLOBIN A1 C ESTIMATION**

Specimen: Blood EDTA

Hb A1C <small>HPLC, NGSP Certified</small>	5.2	%	>8 : Action Suggested , 7-8 : Good Control , <7 : Goal , 6-7 : Near Normal Glycemia, <6 : Non-diabetic Level
Mean Blood Glucose <small>Calculated</small>	102.54	mg/dL	

**Criteria for the diagnosis of diabetes:**

- HbA1c  $\geq$  6.5 %Or
  - Fasting plasma glucose  $\geq$  126 gm/dL. Fasting is defined as no caloric intake at least for 8 hrs.Or
  - Two hour plasma glucose  $\geq$  200mg/dL during an oral glucose tolerance test by using a glucose load containing equivalent of 75 gm anhydrous glucosedissolved in water.Or
  - In a patient with classic symptoms of hyperglycemia or hyperglycemic crisis, a random plasma glucose  $\geq$  200 mg/dL.
- \*In the absence of unequivocal hyperglycemia, criteria 1-3 should be confirmed by repeat testing. American diabetes association. Standards of medical care in diabetes 2011. Diabetes care 2011;34:S11.

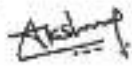

**Importance of HbA1C (Glycated Hb.) in Diabetes Mellitus:**

- HbA1C, also known as glycated hemoglobin, is the most important test for the assessment of long term blood glucose control( also called glycaemic control).
- HbA1C reflects mean glucose concentration over pas 6-8 weeks and provides a much better indication of longterm glycaemic control than blood glucose determination.
- HbA1c is formed by non-enzymatic reaction between glucose and Hb. This reaction is irreversible and therefore remains unaffected by short term fluctuations in blood glucose levels.
- Long term complications of diabetes such as retinopathy (Eye-complications), nephropathy (kidney-complications) and neuropathy (nerve complications), are potentially serious and can lead to blindness, kidney failure, etc.- Glycaemic control monitored by HbA1c measurement using HPLC method (GOLD STANDARD ) is considered most important. **THYROID FUNCTION TEST**

T3 (Triiodothyronine) CMA	1.05	ng/mL	0.6 - 1.81
T4 (Thyroxine) CMA	6.99	µg/dL	4.5 - 12.5
TSH ELFA-Enzyme Linked Fluorescent Assay	1.980	µIU/ml	0.35 - 4.94

Thyroid stimulating hormone (TSH) is synthesized and secreted by the anterior pituitary in response to a negative feedback mechanism involving concentrations of FT3 (free T3) and FT4 (free T4). Additionally, the hypothalamic tripeptide, thyrotropin-releasing hormone (TRH), directly stimulates TSH production. TSH stimulates thyroid cell production and hypertrophy, also stimulate the thyroid gland to synthesize and secrete T3 and T4. Quantification of TSH is significant to differentiate primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low.

TSH levels During Pregnancy :

First Trimester : 0.1 to 2.5 µIU/mL

Second Trimester : 0.2 to 3.0 µIU/mL

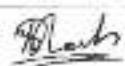

Third Trimester : 0.3 to 3.0 µIU/mL
