### Glycosylated Hemoglobin (HbA1C)

|                                  |     |   |
|----------------------------------|-----|---|
| HbA1C                            | 5.1 | % |
| Estimated average plasma Glucose | 100 | % |

#### Interpretation:

As per American Diabetes Association (ADA):

| Reference Group                         | HbA1c (%)  |
|---|--|
| Non-diabetic adults > 18 years          | < 5.7  |
| At Risk (Pre-diabetes)                  | 5.7-6.4  |
| Diagnosed Diabetes                      | ≥ 6.5  |
| Therapeutic goals for glycaemic control | Age < 18 years: Goal of therapy: < 7.0<br>Age > 18 years: Goal of therapy: < 7.5 |

#### Note

1. Since HbA1c reflects long-term fluctuations in the blood glucose concentration, a diabetic patient who is usually under good control may still have a high concentration of HbA1c. Conversely it is true for a diabetic previously under good control but now poorly controlled.
2. Target goals of < 7.0% may be beneficial in patients with short duration of diabetes, long life expectancy and no significant cardiovascular disease. In patients with significant complications of diabetes, limited life expectancy or extensive comorbid conditions, targeting a goal of < 7.0% may not be appropriate.

#### Comments:

HbA1c provides an index of average blood glucose levels over the past 8 - 12 weeks and is a much better indicator of long-term glycaemic control, as compared to blood sugar *unfasting glucose concentrations*.

#### ADA criteria for correlation between HbA1c & Mean plasma glucose levels.

| HbA1c (%) | Mean Plasma Glucose (mg/dL) |
|-----------|-----------------------------|
| 5         | 109                         |
| 6         | 126                         |
| 7         | 153                         |
| 8         | 183                         |
| 9         | 213                         |
| 10        | 240                         |
| 11        | 269                         |
| 12        | 298                         |

**CHOLESTEROL** in arteries and in vessels are the important plasma lipids. In addition, cholesterol is a risk factor and in the management of cardiovascular disease. Highest acceptable and optimum values of cholesterol vary with age. Values above 220 mg/dl are associated with increased risk of CHD regardless of HDL & LDL values.

**TRIGLYCERIDE** level >250 mg/dl is associated with an approximately 5-fold greater risk of coronary vascular disease. Elevation of TRIGLYCERIDE can be seen in obesity, medication, fast less than 12 hrs., alcohol intake, diabetes mellitus, and pancreatitis.

**HDL-CHOLESTEROL** level <45 mg/dl is associated with an increased risk of coronary heart disease even in the face of desirable levels of cholesterol and LDL-cholesterol.

**LDL-CHOLESTEROL & TOTAL CHOLESTEROL** levels can be strikingly altered by thyroid, renal and liver disease as well as

|-----------|-------|------|-------------------------|
|-----------|-------|------|-------------------------|

Hereditary factors. Based on total cholesterol, LDL-cholesterol, and total cholesterol/HDL-cholesterol ratio, patients may be divided into three risk categories:

|                      | TOTAL CHOLESTEROL | LDL-CHOLESTEROL | TC/HDL RATIO |
|----------------------|-------------------|-----------------|--------------|
| Acceptable/Low Risk  | <200 mg/dL        | <130 mg/dL      | <5           |
| Borderline High Risk | 200-239 mg/dL     | 130-159 mg/dL   | 5-6          |
| High Risk            | ≥240 mg/dL        | ≥160 mg/dL      | ≥6           |

**APOLIPROTEIN A1 & B** Recent studies have shown that Apo lipoproteins A1 & B may play the key indicators of coronary artery disease risk in an individual. Patients who have normal lipid profile may have abnormal Apo A1 & Apo B values. Ratio of Apo B/Apo A1 is 0.1 in absence of increased CHD risk.

**IMMUNOASSAY**

**Thyroid Profile Total**

|  |      |        |              |
|--|------|--------|--------------|
| Triiodothyronine Total (TT3)<br><small>CLIA</small>                  | 1.35 | ng/dL  | 0.69 - 2.15  |
| Thyroxine - Total (TT4)<br><small>CLIA</small>                       | 9.65 | ug/dl  | 5.00 - 13.00 |
| Thyroid Stimulating Hormone (TSH)<br><small>Radioimmunoassay</small> | 4.15 | uIU/ml | 0.30 - 4.50  |

**COMMENTS:**

Assay results should be interpreted in context to the clinical condition and associated results of other investigations. Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal. Results are invalidated if the client has undergone a radiiodine scan within 7-14 days before the test. Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of condition is resolved. The production, circulation, and disintegration of thyroid hormones are altered throughout the stages of pregnancy.

| PREPARED BY               | REFERENCE RANGE (for TSH) IN uIU/ml (As per American Thyroid Association) |
|---------------------------|---|
| 1 <sup>st</sup> Trimester | 0.1-0.50 uIU/ml /m  |
| 2 <sup>nd</sup> Trimester | 0.10-0.40 uIU/ml /m   |
| 3 <sup>rd</sup> Trimester | 0.10-0.40 uIU/ml /m   |

- TSH IS DONE BY ULTRA SENSITIVE 4<sup>TH</sup> GENERATION CHEMILUMINESCENT ASSAY\*

**INTERPRETATIONS**

1. Primary hyperthyroidism is accompanied by elevated serum T3 & T4 values along with decreased TSH level.
2. Primary hypothyroidism is accompanied by depressed serum T3 and T4 values & elevated serum TSH levels.
3. Normal T4 levels accompanied by high T3 levels and low TSH are seen in patients with T3 thyrotoxicosis.
4. Normal or low T3 & high T4 levels indicate T4 thyrotoxicosis (problems in conversion of T4 to T3).
5. Normal T3 & T4 along with low TSH indicate a defect in central HYPERTHYROIDISM.
6. Normal T3 & low T4 along with high TSH is seen in HYPOTHYROIDISM.
7. Normal T3 & T4 levels with high TSH indicate Mild / Subclinical HYPOTHYROIDISM.
8. Slightly elevated T3 levels may be found in pregnancy and in estrogen therapy while depressed levels may be encountered in severe illness, malnutrition, renal failure and during therapy with drug like propranolol.
9. Abnormally elevated TSH levels are nearly always indicative of primary hypothyroidism. Rarely they can result from TSH secreting pituitary tumours (secondary hyperthyroidism).
