PROSTATE SPECIFIC ANTIGEN

Test Description	Result	Unit	Biological Reference Range
PSA (Prostate Specific Antigen)-Serum Total	0.49	ng/ml	Conventional for all ages: 0 - 4 69- 80 Years : 0 - 6.5 Above 80 yrs: 0 - 7.2

Method : ECLIA

INTERPRETATION :

Prostate-specific antigen (PSA) is a glycoprotein that is produced by the prostate gland, the lining of the urethra, and the bulbourethral gland. PSA exists in serum mainly in two forms, noncomplexed to alpha-1-antitrypsin (PSA-ACT complex) and unbound (free PSA). Increases in prostate glandular size and tissue damage caused by benign prostatic hypertrophy, prostatitis, or prostate cancer may increase circulating PSA levels. Transient increase in PSA can also be seen following per rectal digital or endorectal examinations.

VITAMIN D- TOTAL (25-OH-VIT D)- SERUM

Test Description	Result	Unit	Biological Reference Range
Vitamin D- Total (25-OH-Vit D)			
Vitamin D- Total (25-OH-Vit D)- Serum	26.3	ug/ml	2-10 : Deficiency 10-30 : Insufficiency 30-100 : Sufficiency > 100 : Toxicity

Method : ECLIA

INTERPRETATION:

Vitamin D is a fat soluble vitamin & exists in two main forms as calcitriol (Vitamin D3) which is synthesized in skin from 7-dehydrocholesterol in response to sunlight exposure & Ergocalciferol (Vitamin D2) present mainly in dietary sources. Both calcitriol & Ergocalciferol are converted to 25 (OH) Vitamin D in liver.

Testing for 25 (OH) Vitamin D is recommended as it is the best indicator of Vitamin D nutritional status as obtained from sunlight exposure & dietary intake.

- 25 OH Vitamin D is the best indicator of Vitamin D nutritional status. It is used as an aid in assessment of Vitamin D deficiency in adults.
- 25 OH Vitamin D deficiency is seen in secondary hyperparathyroidism.
- Decreased levels of 25 OH Vitamin D can lead to Osteomalacia, reduced bone mass & thus increase the risk of bone fractures.
- Decreased 25 OH Vitamin D levels are also associated with low bone mineral density & also seen in nutritional rickets.
- Decreased levels of 25 OH Vitamin D are also associated with increased cardiovascular risk, low immunity & chronic renal failure.
- Elevated levels are associated with Vitamin D intoxication.

HBA1C-GLYCOSYLATED HAEMOGLOBIN

Test Description	Result	Unit	Biological Reference Range
HbA1c (EDTA WB)	8.0	%	< 5.6 Non-diabetic 5.7-6.4 Pre-diabetic > 6.5 Diabetic
Estimated Average Glucose (eAG)	125.50	mg/dL	
Method : HPLC-Biurd D10-USA			

INTERPRETATION

- HbA1c is used for monitoring diabetic control. It reflects the estimated average glucose (eAG).
- HbA1c has been endorsed by clinical groups & ADA (American Diabetes Association) guidelines 2017, for diagnosis of diabetes using a cut-off point of 6.5%.
- Trends in HbA1c are a better indicator of diabetic control than a solitary test.
- Low glycosylated haemoglobin (below 4%) in a non-diabetic individual are often associated with systemic inflammatory diseases, chronic anaemia (especially severe iron deficiency & haemolytic), chronic renal failure and liver diseases. Clinical correlation suggested.
- To estimate the eAG from the HbA1c value, the following equation is used: $eAG(mg/dL) = 28.7 \times A1c - 46.7$
- Interference of Haemoglobinopathies in HbA1c estimation
 - For HbF > 25%, an alternate platform (Fructosamine) is recommended for testing of HbA1c.
 - Homozygous hemoglobinopathy is detected, fructosamine is recommended for monitoring diabetic status.
 - Heterozygous state detected (D19/ Tokyo US is corrected for HbS and HbC trait).
- In known diabetic patients, following values can be considered as a tool for monitoring the glycaemic control.
 - Excellent Control - 6 to 7 %
 - Fair to Good Control - 7 to 8 %
 - Unsatisfactory Control - 8 to 10 %
 - Poor Control - More than 10 %

Note : Haemoglobin electrophoresis (HPLC method) is recommended for detecting hemoglobinopathy

VITAMIN B12- SERUM

Test Descriptor	Result	Unit	Biological Reference Range
Vitamin B12- Serum	187.0	pg/ml	197.0 - 771.0
Method : ECLIA			

INTERPRETATION

- Vit B12 levels are decreased in megaloblastic anemia, partial/total gastrectomy, pernicious anemia, peripheral neuropathies, chronic alcoholism, senile dementia, and treated epilepsy.
- An associated increase in homocysteine levels is an independent risk marker for cardiovascular disease and deep vein thrombosis.
- Very high levels (> 1200) may be seen for several weeks after injections of B12.
