Interpretation:

* A high fat meal may cause decreased bilirubin levels by interfering with the clinical reactions. GT activity is elevated in all forms of liver disease. This test is much more sensitive than either the alkaline phosphatase test or the transaminase test (i.e. SGOT, SGPT) in detecting obstructive jaundice, cholestasis, and cholelithiasis. It is also indicated in the differential diagnosis of liver disease in children and pregnant women who have elevated levels of LDH1 and alkaline phosphatase.
