**TEST REPORT**

Crystals	Absent	Phosphate, oxalate, or urate crystals may be seen
Method:Flow Digital Imaging/Microscopy		
Others	Nil	Nil
Method:Flow Digital Imaging/Microscopy		

**Method: Semi Quantitative test ,For CUE**

**Reference:** Godkar Clinical Diagnosis and Management by Laboratory Methods, First South Asia edition. Product kit literature.

**Interpretation:**

The complete urinalysis provides a number of measurements which look for abnormalities in the urine. Abnormal results from this test can be indicative of a number of conditions including kidney disease, urinary tract infection or elevated levels of substances which the body is trying to remove through the urine . A urinalysis test can help identify potential health problems even when a person is asymptomatic. All the abnormal results are to be correlated clinically.

TEST REPORT

DEPARTMENT OF HEMATOPATHOLOGY

Blood Grouping ABO And Rh Typing, EDTA Whole Blood

Parameter	Results
Blood Grouping (ABO)	A
Rh Typing (D)	Positive
Method:Hemagglutination Tube Method by Forward & Reverse Grouping	

**Method:** Hemagglutination Tube Method by Forward & Reverse Grouping

**Reference:** Tulip kit literature

**Interpretation:** The ABO grouping and Rh typing test determines blood type grouping (A,B, AB, O ) and the Rh factor (positive or negative). A person's blood type is based on the presence or absence of certain antigens on the surface of their red blood cells and certain antibodies in the plasma. ABO antigens are poorly expressed at birth, increase gradually in strength and become fully expressed around 1 year of age. In case of Rh(D) - Du(weak positive) or Weak D positive, the individual must be considered as Rh positive as donor and Rh negative as recipient.

**Note:** Records of previous blood grouping/Rh typing not available. Please verify before transfusion.

**Method:** Automated Hematology Cell Counter, Microscopy

**Reference:** Dacie and Lewis Practical Hematology, 12th Edition.  
Wallach's interpretation of diagnostic tests, Soth Asian Edition.

**Interpretation:** A Complete Blood Picture (CBP) is a screening test which can aid in the diagnosis of a variety of conditions and diseases such as anemia, leukemia, bleeding disorders and infections. This test is also useful in monitoring a person's reaction to treatment when a condition which affects blood cells has been diagnosed. All the abnormal results are to be correlated clinically.

**Note:** These results are generated by a fully automated hematology analyzer and the differential count is computed from a total of several thousands of cells. Therefore the differential count appears in decimalised numbers and may not add upto exactly 100. It may fall between 99 and 101.

**TEST REPORT**

**DEPARTMENT OF CLINICAL CHEMISTRY I**

**Alanine Aminotransferase (ALT/SGPT), Serum**

Investigation	Observed Value	Biological Reference Interval
Alanine Aminotransferase ,(ALT/SGPT) Method:UV without P5P	22	<45 U/L

**Interpretation:** This test measures levels of Alanine Aminotransferase (ALT) in the blood. ALT is an enzyme found in the cells of the liver. Increased levels of ALT are typically produced when the liver is damaged. ALT testing is often done to monitor treatment for liver disease or when a person is experiencing symptoms of liver disorders.

**Reference:** Tietz Fundamentals of Clinical Chemistry and Molecular Diagnostics.

**Bilirubin Total , Serum**

Investigation	Observed Value	Biological Reference Interval
Total Bilirubin. Method:Diazo method	1.22	<1.2 mg/dL

Note Kindly correlate clinically

**Interpretation:** This test measures total Bilirubin levels in the blood. Bilirubin is a waste product from the breakdown of old red blood cells which is processed by the liver for removal from the body. Abnormally high bilirubin levels are often indicative of liver disease. High bilirubin levels can be caused by a number of conditions including hepatitis, cirrhosis, alcoholism, cholangitis, infectious mononucleosis, anorexia and anemia. Due to the variety of conditions which can affect bilirubin levels, results often need to be interpreted along with additional tests.

**Blood Urea Nitrogen (BUN), Serum**

Investigation	Observed Value	Biological Reference Interval
Blood Urea Nitrogen. Method:Calculated	7	6-20 mg/dL
Urea. Method:Urease/UV	15.3	12.8-42.8 mg/dL

**Interpretation:** Urea is a waste product formed in the liver when protein is metabolized. Urea is released by the liver into the blood and is carried to the kidneys, where it is filtered out of the blood and released into the urine. Since this is a continuous process, there is usually a small but stable amount of urea nitrogen in the blood. However, when the kidneys cannot filter wastes out of the blood due to disease or damage, then the level of urea in the blood will rise. The blood urea nitrogen (BUN) evaluates kidney function in a wide range of circumstances, to diagnose kidney disease, and to monitor people with acute or chronic kidney dysfunction or failure. It also may be used to evaluate a person's general health status as well.

**Reference:** Tietz Fundamentals of Clinical Chemistry and Molecular Diagnostics

**Creatinine, Serum**

Investigation	Observed Value	Biological Reference Interval
---------------	----------------	-------------------------------

Name	: MR.VAGGU GANESH	TID/SID	: UMR1798055/ 27993795P
Age / Gender	: 26 Years / Male	Registered on	: 30-Jul-2024 / 08:45 AM
Ref.By	: SELF	Collected on	: 30-Jul-2024 / 13:33 PM
Req.No	: BIL4531043	Reported on	: 30-Jul-2024 / 16:30 PM
		Reference	: Arcofemi Health Care Ltd -

**TEST REPORT**

Creatinine. 0.86 0.70-1.20 mg/dL  
Method:Alkaline Picrate

**Interpretation:**

Creatinine is a nitrogenous waste product produced by muscles from creatine. Creatinine is majorly filtered from the blood by the kidneys and released into the urine, so serum creatinine levels are usually a good indicator of kidney function. Serum creatinine is more specific and more sensitive indicator of renal function as compared to BUN because it is produced from muscle at a constant rate and its level in blood is not affected by protein catabolism or other exogenous products. It is also not reabsorbed and very little is secreted by tubules making it a reliable marker. Serum creatinine levels are increased in pre renal, renal and post renal azotemia, active acromegaly and gigantism. Decreased serum creatinine levels are seen in pregnancy and increasing age.

**Glucose Fasting (FBS), Sodium Fluoride Plasma**

Investigation	Observed Value	Biological Reference Interval
Glucose Fasting Method:Hexokinase	92	Normal: <100 mg/dL Impaired FG: 100-125 mg/dL Diabetes mellitus: >=126 mg/dL

**Interpretation:** It measures the Glucose levels in the blood with a prior fasting of 9-12 hours. The test helps screen a symptomatic/ asymptomatic person who is at risk for Diabetes. It is also used for regular monitoring of glucose levels in people with Diabetes.

**Reference:** American Diabetes Association. Standards of Medical Care in Diabetes-2022

**Glucose Post Prandial (PPBS), Sodium Fluoride Plasma**

Investigation	Observed Value	Biological Reference Interval
Glucose Post Prandial Method:Hexokinase	87	Normal : <140 mg/dL Impaired PG: 140-199 mg/dL Diabetes mellitus: >=200 mg/dL

**Note** The discordant post prandial blood glucose values levels are observed in some of the conditions related to defective absorption, insufficient dietary intake, endocrine disorders, hypoglycemic drug overdose and reactive hypoglycemia etc.

**Interpretation:** This test measures the blood sugar levels 2 hours after a normal meal. Abnormally high blood sugars 2 hours after a meal reflect that the body is not producing sufficient insulin which is indicative of Diabetes.

**Reference:** American Diabetes Association. Standards of Medical Care in Diabetes-2022
