Method : **Fluorescence Immunoassay Technology**

Sample Type : **Fresh Blood Serum**

### Remarks :

Primary malfunction of the Thyroid gland may result in excessive (hyper) or Low (hypo) release of T3 or T4. In addition, as TSH directly affect thyroid function, malfunction of the pituitary or the hypothalamus influences the thyroid gland activity.

Disease in any portion of the thyroid-pituitary-hypothalamus system may influence the level of T3 and T4 in the blood, in Primary Hypothyroidism,

TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels may be low. In addition, in Euthyroid sick syndrome, multiple alterations in serum thyroid function test findings have been recognized.

Ultrasound scan is an investigation and therefore has technical limitations as well as inaccuracies inherent in the laboratory and statistical analysis of biological process. It should always be viewed in this perspective. Further this is a routine general scan grossly containing information sought by ref consultant and report generated thus, is for his perusal only. Considering pace of advances in the field of sonography, more specified information can also be obtained by prior intimation.
