LDL/HDL Cholesterol Ratio ,Serum Plain <i>Method : Calculated</i>	1.85		

Guidelines for Total Blood Cholesterol Levels on 11 to 12 hour fasting samples.

Desirable : Less than 200 mg/dl

Borderline High Risk : 200 to 239 mg/dl

High Risk : 240 mg/dl and over, on repeated values

Optimal Level for Cardiac Patients : Less than 200 mg/dl

HDL-C : High HDL has generally been found to be protective, decreasing the risk of coronary Artery disease (CAD) in most people. However, some recent studies have shown that in some people with high HDL, the HDL is not protective and may, in fact result in higher risk for CAD than in people with normal HDL levels. In one study it was shown that people with CAD and high HDL had underlying genetic anomalies in enzymes important in lipid turnover. Another study showed that high levels of abnormally large HDL particles were associated with increased risk of CAD. Factors that elevate HDL concentrations include chronic alcoholism, treatment with oral estrogen replacement therapy, extensive aerobic exercise, and treatment with niacin, statins, or fibrates. Smoking reduces levels of HDL cholesterol, while quitting smoking leads to a rise in the plasma HDL level.

Triglycerides

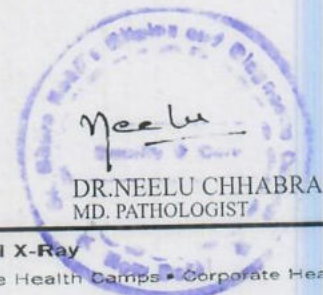

Female	40 - 140
Male	60 - 165

Adult levels:

Optimal	<100 mg/dL
Near Optimal/ above optimal	100 - 129 mg/dL

**SEROLOGY**

Hepatitis 'B' Surface Antigen ,Serum Plain  
(Rapid card)

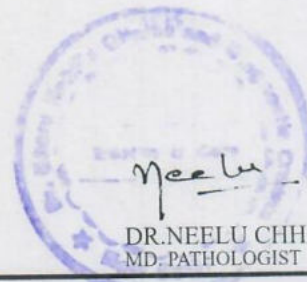

NON-REACTIVE

NON-REACTIVE

**Comment:**

This is the initial detectable marker found in the serum in the incubation period of HBV infection. The titre of HBsAg peaks at or shortly after the onset of elevated serum enzymes. The clinical improvement and decrease in enzyme concentration is paralleled by a fall in HBsAg titres and subsequent disappearance. The duration of HBsAg positivity is variable depending on the clinical course of the disease. HBsAg is detected in serum a month after the exposure, peaking in the preicteric phase and disappearing 1-13 weeks after onset of enzyme abnormalities. Persistence of HBsAg after complete clinical recovery indicates a carrier state. Vaccination against HBV does not cause HBsAg positivity.

Causes of HBsAg positivity are acute HBV infection, reactivation of chronic HBV infection, HBsAg seroconversion to anti-Hbe flare. Uses of HBsAg test are in diagnosing HBV infection, monitoring the status of infected individuals & evaluating the efficiency of antiviral drugs.
