INTERPRETATION

In primary hypothyroidism, thyroid-stimulating hormone (TSH) levels will be elevated and in primary hyperthyroidism, TSH levels will be low. In Hypothyroidism there is decreased production of thyroid hormones by the thyroid hence the person may experience symptoms such as weight gain, dry skin, constipation, cold intolerance, and fatigue. Iodine deficiency and Hashimoto thyroiditis is the most common cause of hypothyroidism. If the thyroid releases inappropriately large amounts of T4 and T3, the affected person may experience symptoms associated with Hyperthyroidism, such as rapid heart rate, weight loss, nervousness, hand tremors, irritated eyes, and difficulty in sleeping. Graves disease is the most common cause of hyperthyroidism. Several medications including dopamine and glucocorticoids or excessive use of dietary supplements containing Biotin may affect TSH results. For diagnostic purpose a test result should always be assessed in conjunction with the individual's medical history, clinical examination and other findings.

Parameter	Result	Bio. Ref. Interval
-----------	--------	--------------------

BANK OF BARODA

DEPARTMENT OF BIOCHEMISTRY

GLYCOSYLATED HAEMOGLOBIN - HbA1c (Method: HPLC)	6.6 %	Normal: < 5.7 Diabetic: > 6.5 Pre Diabetic: 5.7 - 6.4 Good Control: 6.5 - 7 Weak Control: > 7.8 Poor Control: > 8
--	-------	--

INTERPRETATION
INTERPRETATION :

HbA1c is an indicator of glycemic control. HbA1c represents average glycemia over the past six to eight weeks. Glycation of hemoglobin occurs over the entire 120 day life span of the red blood cell, but within this 120 days. Recent glycemia has the largest influence on the HbA1c value. Clinical studies suggest that a patient in stable control will have 50% of their HbA1c formed in the month before sampling, 25% in the month before that, and the remaining 25% in months two to four.

Mean Plasma Glucose mg/dl = (HbA1c x 35.6) - 77.3

Correlation between HbA1c and Mean Plasma Glucose (MPG) is not "perfect" but rather only .81 (1.0 would be a straight line, which has "perfect" correlation...) This means that to predict or estimate average glucose from Hb-A1c or vice-versa is not "perfect" but gives a good working ballpark estimate. Afternoon and evening results correlate more closely to HbA1c than morning results, perhaps because morning fasting glucose levels vary much more than daytime glucose levels, which are easier to predict and control.

BARCODE :

ULTRASOUND - ABDOMEN

Liver : Size (138 mm), Shape, contour normal with increased echotexture.
No localized or diffused mass lesions are seen. Intrahepatic vascular system,
Portal vein, C.B.D. and biliary radicals are normal.

Gall Bladder: Contracted

Spleen : Size : 89 mm, Shape and echotexture normal, No abnormal calcifications seen.

Pancreas : Head, body and tail echotexture are normal. Pancreatic duct normal.
No mass or cystic lesions seen. No calcifications are seen.

Kidneys :

Right kidney Measures : 103 x 414 mm

Left kidney Measures : 99 x 47 mm

Peri renal areas normal, Renal capsule normal, Cortical thickness, Cortical echopattern and corticomedullar differentiation are normal. Pelvicalyceal system normal.

No calculus or no mass lesions seen.

Urinary Bladder:

Minimally distended, Normal wall thickness. No evidence of calculi. No focal lesions.

Uterus : Size : 60 x 40 x 41 mm,

Evidence of hypo echoic area noted in posterior myometrium
measuring 11 x 10 mm with no vascularity.

Anteverted. Normal in size, Shape and echotexture.

Endometrium Thickness 5.4 mm . No focal lesions.

Ovaries : Could not be visualized due to sub optimal window.

Others : Aorta and IVC are normal. No lymphadenopathy. No ascitis.

IMPRESSION:

- Grade I fatty liver.
- Right tiny renal calculus.
- F/S/O Uterine fibroid.

Adv TVS for further evaluation if clinically indicated.
