## COMPLETE BLOOD COUNT CBC (COMPLETE BLOOD COUNT)

Parameter	Result	Unit	Reference Range
HAEMOGLOBIN	14.30	GM/DL	13.5 - 18.0
<b>Total Hemoglobin (Hgb or Hb)</b> - A Low hemoglobin level indicates anemia. Hemoglobin in the body is dependent upon amounts of iron. A lack of available iron causes one type of anemia, due to the reduced production of hemoglobin. A low level of Hemoglobin is a sign of anemia.			
TOTAL LEUCOCYTE COUNT(TLC)	8100	/cumm	4000 - 11000
<b>D.L.C</b>			
MONOCYTES	0	%	02 - 10
LYMPHOCYTES	27	%	20 - 45
EOSINOPHILS	05	%	01 - 06
BASOPHILS	0	%	0 - 0
NEUTROPHIL	68	%	40 - 75
E.S.R. (WESTEGREN'S)	39.0 (High)	mm/1st hr	0 - 20

**ESR(Erythrocyte Sedimentation Rate)**-The ESR measures the time required for erythrocytes from a whole blood sample to settle to the bottom of a vertical tube. Factors influencing the ESR include red cell volume, surface area, density, aggregation, and surface charge. The ESR is a sensitive, but nonspecific test that is frequently the earliest indicator of disease. It often rises significantly in widespread inflammatory disorders due to infection or autoimmune mechanisms. Such elevations may be prolonged in localized inflammation and malignancies.  
Increased ESR: may indicate pregnancy, acute or chronic inflammation, tuberculosis, rheumatic fever, paraproteinemias, rheumatoid arthritis, some malignancies, or anemia.  
Decreased ESR: may indicate polycythemia, sickle cell anemia, hyperviscosity, or low plasma protein.

RBC COUNT 4.98 Millions/cmm 4.5 - 5.5

**Red cells**-The number of red cells is given as an absolute number per litre. Iron deficiency Anemia shows up as a Low RBC count. A count of actual (or estimated) number of RBC's per cubic mm of whole blood.

P.C.V/ HAEMATOCRIT 44.5 % 40 - 54

HAEMOGLOBIN CHROMATOGRAPHY, HPLC  
Hb F 0.0 % ( 1.00 - 2.00 )  
PEAK 2 0 %  
PEAK 3 0 %  
Hb ADULT 0 %

Unknown 2 0.00 %  
Other (Non Specific) 0.00 % ( < 10.00 )  
Suggestive Interpretation : Normal Hb Chromatographic Pattern.

## M C V

**MCV- Mean Corpuscular Volume .** The average volume of the red cells, measured in femtolitres. Anemia is classified as microcytic if the MCV value is above or below the expected normal range; anemias are classified as normocytic if the MCV is within the expected range. The MCV indicates the relative size of the RBC's. It does not indicate anything else about the cell. Several different types of anemias can be classified as micro- or macrocytic anemias. This test can direct the MD toward those types of anemias which alter the MCV results.

## M C H

**MCH- Mean Corpuscular Hemoglobin:** (Weight of hemoglobin, in each cell). The average amount of hemoglobin per red blood cell, in picograms.

## M C H C

**MCH- Mean Corpuscular Hemoglobin:** (Weight of hemoglobin in each cell). The average amount of hemoglobin per red blood cell, in picograms.

## PLATELET COUNT

**Platelets-**Platelet numbers are given, as well as information about their size and the range of sizes in the blood. Mean platelet volume (MPV): A measurement of the average size of platelets. Platelets normally increase in persons living at high altitudes for extended periods of time. They also increase with persistent cold temperatures, and during strenuous exercise and excitement. The count decreases just prior to menstruation.

## LIPID PROFILE (LIPID PROFILE)

## THYROID PROFILE (THYROID PROFILE)

Parameter	Result	Unit	Reference Range
T3	2.70	ng/ml	1.23 - 3.07
T4	118.0	ug/dl	66.0 - 181.0
TSH	2.1	uIU/mL	0.3 - 4.2

### REFERENCE RANGE

#### PAEDIATRIC AGE GROUP

0-3 DAYS	1-20 uIU/ml
3-30 DAYS	0.5 - 6.5 uIU/ml
1 MONTH -5 MONTHS	0.5 - 6.0 uIU/ml
6 MONTHS- 18 YEARS	0.5 - 4.5 uIU/ml
ADULTS	0.35 - 5.50 uIU/ml

**Note:** TSH levels are subject to circadian variation, rising several hours before the onset of sleep, reaching peak levels between 11 pm to 6 am. Nadir concentrations are observed during the afternoon. Diurnal variation in TSH level approximates + 50 %, hence time of the day has influence on the measured serum TSH concentration.

## SEROLOGY TEST

Parameter	Result	Unit	Reference Range
TOTAL PSA	2.0	ng/ml	0 - 4

### INTERPRETATION :

Expected Values :

99% : of Healthy males 0.0-4.0 ng/ml  
 80% : of Benign prostatic hypertrophy 0.0-4.0 ng/ml  
 81% : of Prostatic Carcinomas Above 4.0 ng/ml

PSA is reliable tumour marker for already diagnosed prostatic carcinomas. It is uniquely associated only with prostatic tissue, and therefore is specific for it. Baseline levels measured prior to therapeutic intervention and followed later by serial periodical measurements will predict the outcome of therapy. It also helps in early discovery of recurrences, relapses and metastases.

### RECOMMENDED TESTING INTERVALS :

First Determination : Preoperatively (Baseline)  
 Second Determination : 2-4 days Postoperatively  
 Third Determination : Before discharge from hospital  
 Follow-up Determinations

If levels are high/show rising trend : Monthly  
 If levels are normal : Every 3 monthly initially, later annually.

In general, tumor marker levels are directly proportional to the tumour mass and the stage of the cancer. However, it is the rate of change of the tumor marker level which is more important rather than its absolute value. A 50% change may be considered clinically significant. It must be emphasised that PSA may also be elevated in benign prostatic hypertrophy and inflammatory conditions of the surrounding genitourinary tract. Therefore, this parameter should never be used as a screening test for diagnosing prostatic carcinomas but only as an aid in follow up studies.

#### EXPECTED VALUES :-

Metabolically healthy patients = 4.8 - 5.5 % HbA1C

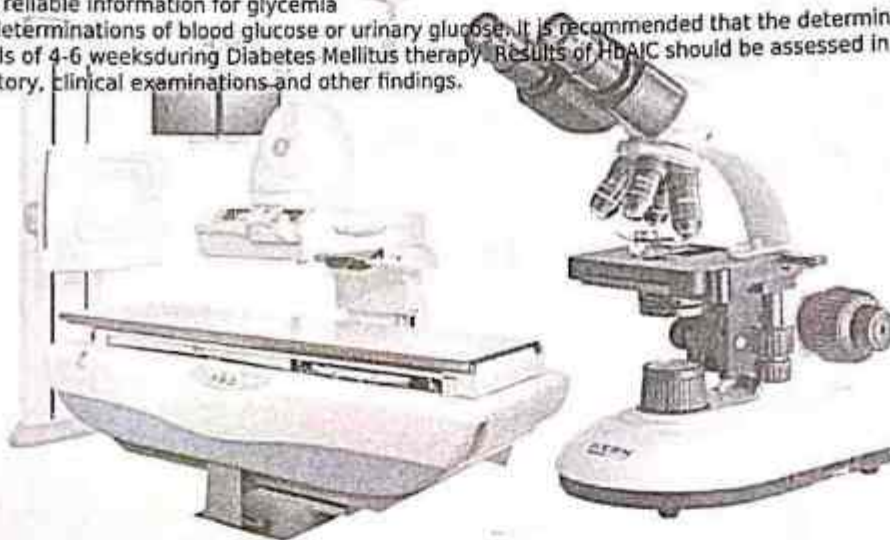

Good Control = 5.5 - 6.8 % HbA1C

Fair Control = 6.8-8.2 % HbA1C

Poor Control = >8.2 % HbA1C

#### REMARKS:-

In vitro quantitative determination of HbA1C in whole blood is utilized in long term monitoring of glycemia. The HbA1C level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 6-8 weeks) and therefore provides much more reliable information for glycemia monitoring than do determinations of blood glucose or urinary glucose. It is recommended that the determination of HbA1C be performed at intervals of 4-6 weeks during Diabetes Mellitus therapy. Results of HbA1C should be assessed in conjunction with the patient's medical history, clinical examinations and other findings.

## ULTRASOUND

### WHOLE ABDOMEN MALE

#### Result :

**LIVER:** - diffuse increase in echogenicity

Normal in size and Echopattern. Intra and Extra hepatic Biliary Radicals are normal. Portal and hepatic veins are normal.

**GALL BLADDER:** - partially Distended and filled with multiple echogenic foci with distal acoustic shadow

CBD: normal in caliber & course

**SPLEEN:** - Measures ..10.8.cm Normal in Size Echopattern. No Focal or Diffuse lesion seen. Splenic vein is Normal.

**PANCREAS:** - Normal in size, Shape, and Echopattern.

**KIDNEYS:** - Normal in Site, Size, and Echopattern, Pelvi-calyceal System of Both Kidneys are Normal, No Calculi seen, No Hydronephrosis seen,

**URINARY BLADDER:** - moderately Distended, No Calculi /Mass /Irregularity of the wall seen.

**PROSTATE:** - Size: Enlarged  
Volume: -32.29ml

Echo: Normal

No Ascites / Pleural Effusion, No Obvious Abdominal Lymphadenopathy, IVC and AORTA are Normal

IMP: 1. Fatty liver 2. cholithiasis 3. mild prostomegaly
