

REQ : 26/08/2023
REPORT : 26/08/2023

LOC REQ NO : 148901
PATIENT'S NAME : MRS. SAVITRA
AGE / SEX : 59 Y / F
REFD BY : DR. CMO

USG whole ABDOMEN

Liver is normal in size and echotexture. No apparent focal lesion is seen. The intrahepatic biliary radicals are not dilated. Portal vein is normal in diameter.

Gall bladder is adequately distended. Wall thickness appears normal. No calculus/ mass is seen. CBD is normal in caliber with clear lumen.

Pancreas appears normal in size and echotexture.

Spleen appears normal in size and echotexture.

Both kidneys appears normal in size, shape and echotexture. No mass lesion is seen.

Both kidneys show normal parenchymal echotexture.

Cortical thickness and corticomedullary differentiation is maintained.

No apparent calculus / hydronephrosis is seen on both sides.

Urinary bladder is partially distended. Wall thickness appears normal.

Uterus post menopausal status.

No significant lymphadenopathy is noted. No free fluid seen in abdominal cavity.

Test Name Result Unit Biological Ref Interval

1510-HbA1c (glyco HB) **5.7** **%** **4.0 - 5.7**
 SP-Whole Blood
 Method:HPLC

EXPECTED VALUES :-

Guidance for Non diabetics	
Metabolically healthy patients	4.0 - 6.0 %
Good Control	6.0 - 7.0 %
Fair Control	7.0 - 8.0 %
Poor Control	> 8.0 %

Reference Range as per ADA Guidelines	
Below 5.7 %	Normal
5.8 - 6.4 %	Pre-diabetic
≥ 6.5 %	Diabetic

REMARKS :-

In vitro quantitative determination of HbA1c in whole blood is utilized.
 In long term monitoring of glycemia, The HbA1c level correlates with the mean glucose concentration prevailing in the course of the patient's recent history (approx - 6 - 8 weeks) and therefore provides determination of blood glucose or urinary glucose.
 It is recommended that the determination of HbA1c be performed at intervals of 4 - 6 weeks during diabetes mellitus therapy.
 Result of HbA1c should be assessed in conjunction with the patient's medical history clinical examination and other findings.

1559-THYROID PROFILE

1560-TOTAL TRIIODOTHYRONINE (T3) Direct Chemiluminometric Technology	1.34	ng/ml	0.60 - 1.81
1561-TOTAL THYROXINE (T4) Direct Chemiluminometric Technology	10.8	ug/dl	5.5 - 12.5
1562-THYROID STIMULATING HORMONES (TSH) Sandwich CLIA	1.76	uIU/ml	0.50 - 5.00

INTERPRETATION:

THYROID STIMULATING HORMONE (TSH)

The TSH levels are inversely related to T3 & T4 levels. In primary hypothyroidism TSH levels are high while T3&T4 levels are low whereas in primary hyperthyroidism TSH levels are low with high T3&T4 levels. A low T3 & T4 in the presence of low or normal TSH indicates hypothalamic or pituitary dysfunction. A high TSH in the presence of normal or high T4 suggests in appropriate TSH secretion.

INCREASED LEVELS are seen in primary hypothyroidism, inappropriate TSH secretion, systemic illness, rarely in TSH secreting pituitary tumours (secondary hyperthyroidism).

DECREASED LEVELS are seen in secondary hypothyroidism, Hyperthyroidism.

INTERPRETATION:

Serum T3, T4, TSH measurements from the three components of Thyroid screening panel.

TRIIODOTHYRONINE (T3)

INCREASED LEVELS are seen in graves disease, T3 thyrotoxicosis, Thyroid hormone resistance, Functional thyroid adenoma.
DECREASED LEVELS are seen IN Nonthyroidal illness, Hypothyroidism (one third cases)

THYROXINE (T4) - Normal T4 levels accomplished by elevated T3 levels seen in T3 Thyroxiosis.

INCREASED LEVELS are seen in hyperthyroidism, Thyroid hormone resistance.

BIOCHEMISTRY

INVESTIGATION	RESULTS	UNITS	REFERENCE RANGE
LIPID PROFILE (TOTAL CHOLESTEROL,LDL,HDL,TRIGLYCERIDES)			
LIPID PROFILE			
CHOLESTEROL	217	mg/dl	150-250
TRIGLYCERIDE	125	mg/dl	40-150
HDL	43	mg/dl	30-80
LDL	149	mg/dl	60-130
VLDL	25	mg/dl	0 - 30
LDL/HDL RATIO	3.47		0 - 3.55
T. CHOLESTROL/HDL RATIO	5.05	H	0 - 3.3

*** End Of The Report ***

TRIGLYCERIDE level > 250mg/dL is associated with an approximately 2-fold greater risk of coronary vascular disease. Elevation of triglycerides can be seen with obesity, medication, fast less than 12 hrs., alcohol intake, diabetes mellitus, and pancreatitis.

CHOLESTEROL, its fractions and triglycerides are the important plasma lipids in defining cardiovascular risk factors and in the management of cardiovascular disease. Highest acceptable and optimum values of cholesterol values of cholesterol vary with age. Values above 220 mgm/dl are associated with increased risk of CHD regardless of HDL & LDL values.

HDL-CHOLESTEROL level <35 mg/dL is associated with an increased risk of coronary vascular disease even in the face of desirable levels of cholesterol and LDL - cholesterol.

LDL - CHOLESTEROL & TOTAL CHOLESTEROL levels can be strikingly altered by thyroid, renal and liver disease as well as hereditary factors. Based on total cholesterol, LDL- cholesterol, and total cholesterol/HDL - cholesterol ratio, patients may be divided into the three risk categories
