| ESR | 22 | < 20 mm at the end of 1Hr. | WESTERGREN |

INTERPRETATION

ESR (Erythrocyte Sedimentation Rate)-The ESR measures the time required for erythrocytes from a whole blood sample to settle to the bottom of a vertical tube. Factors influencing the ESR include red cell volume, surface area, density, aggregation, and surface charge. The ESR is a sensitive, but nonspecific test that is frequently the earliest indicator of disease. It often rises significantly in widespread inflammatory disorders due to infection or autoimmune mechanisms. Such elevations may be prolonged in localized inflammation and malignancies.

Increased ESR: may indicate pregnancy, acute or chronic inflammation, tuberculosis, rheumatic fever, paraproteinemias, rheumatoid arthritis, some malignancies, or anemia.

Decreased ESR: may indicate polycythemia, sickle cell anemia, hyperfibrinogenemia, or low plasma protein.

Biochemistry

| Test Name | Result | Unit | Biological Reference Interval |
|---|--------|------|---|
| HbA1c (Glycylated Haemoglobin) WB-EDTA | | | |
| HbA1c (Glycylated Haemoglobin) | 5.6 | % | Normal <5.7 % Pre Diabetic 5.7 - 6.4 % Diabetic >6.5 % Target for Diabetes on therapy < 7.0 % Re-evaluation of therapy > 8.0 % Reference ADA Diabetic Guidelines 2013. |

Method : HPLC (High Performance Liquid Chromatography)

Mean Blood Glucose 114.0 mg/dL

Method : Calculated

Correlation of A1C with average glucose

| A1C (%) | Mean Blood Glucose (mg/dl) |
|---------|----------------------------|
| 6 | 126 |
| 7 | 154 |
| 8 | 183 |
| 9 | 212 |
| 10 | 240 |
| 11 | 269 |
| 12 | 298 |

Interpretation :

1.The HbA1c levels correlate with the mean glucose concentration prevailing in the course of Pts recent history (apprx 6-8 weeks) & therefore provides much more reliable information for glycemia control than the blood glucose or urinary glucose. This Methodology is better than the routine chromatographic methods & also for the diabetic pts.having HEMOGLBINOPATHIES OR UREMIA as Hb variants and uremia does not INTERFERE with the results in this methodology.

2.It is recommended that HbA1c levels be performed at 4 - 8 weeks during therapy in uncontrolled DM pts.& every 3 - 4 months in well controlled diabetics.

3.Mean blood glucose (MBG) in first 30 days (0-30)before sampling for HbA1c contributes 50% whereas MBG in 90 - 120 days contribute to 10% in final HbA1c levels
