|---|------|-----------|
| ESR / ERYTHROCYTE SEDIMENTATION RATE | | |
| ESR (Erythrocyte Sedimentation Rate) | 19 | mm/1hr |
| Comments | | 00 - 22 |

The ESR is a simple non-specific screening test that indirectly measures the presence of inflammation in the body. It reflects the tendency of red blood cells to settle more rapidly in the face of some disease states, usually because of increases in plasma fibrinogen, immunoglobulins, and other acute-phase reaction proteins. Changes in red cell shape or numbers may also affect the ESR.

Comments:

Accurate measurement if glucose in body fluid is important in diagnosis and management of diabetes, hypoglycemia, adrenal dysfunction and various other conditions. High levels of serum glucose may be seen in case of diabetes mellitus, in patients receiving glucose containing fluids intravenously, during severe stress and in cerebrovascular accidents. Decreased levels of glucose can be due to insulin administration, as a result of insulinoma, inborn errors of carbohydrate metabolism or fasting.

Note:

TSH levels are subject to circadian variation, rising several hours before the onset of sleep, reaching peak levels between 11 PM to 6 AM. TSH values may be transiently altered because of non thyroidal illness like severe infections, liver disease, renal and heart failure, severe burns, trauma and surgery etc. **Increased** levels are seen in Primary hypothyroidism, Inappropriate TSH secretion, Systemic illness, rarely in TSH secreting pituitary tumours (secondary hypothyroidism). **Decreased** levels are seen in Hyperthyroidism
