Comment:

Increase in serum concentration of TSH is an early and sensitive indicator of decreased thyroid reserve and in conjunction with decreased T4 is diagnostic of primary hypothyroidism. In secondary and tertiary hypothyroidism concentration of T4 are usually low and TSH level are generally low or normal. An increase in T3 without an increase in T4 is frequently associated with recurrent thyrotoxicosis in previously treated patients. Graves disease, which is an autoimmune disorder, most often causes hyperthyroidism and older women may get another form of hyperthyroidism like toxic nodular goiter
