(ADA Standards Jan 2017)

FBS can be less than PPBS in certain conditions like post prandial reactive hypoglycaemia, exaggerated response to insulin, subclinical hypothyroidism, very lean/anxious individuals. In non-diabetic individuals, such patients can be followed up with GTT.

ULTRASONOGRAPHY OF BOTH BREASTS (SCREENING)

All four quadrants of each breast were scanned, followed by evaluation of the subareolar region and axillary tails.

Both breasts parenchyma display a uniform echogenicity and echotexture of the fibrofatty and glandular components, which are in normal proportion for this age and parity.

There is no evidence of any mass lesion, cysts, calcification or ductal dilatation.

Subcutaneous, subareolar and retro mammary soft tissue planes are normal.

There is no evidence of axillary lymphadenopathy.

IMPRESSION:

- No significant abnormality detected.

NB : Negative sonomammogram does not exclude breast cancer. All imaging results must be considered in the context of the clinical findings. In bulky breasts, an underlying lesion may be obscured.

Estimated Average Glucose	116.89	-	-

Interpretation:
1. HbA1C above 6.5% can be used to diagnose diabetes provided the patient has symptoms. If the patient does not have symptoms with HbA1C>6.5%, repeat measurement on further sample. If the repeat test result is <6.5%, consider as diabetes high risk and repeat measurement after 6 months.
2. HbA1C measurement is not appropriate in diagnosing diabetes in children, suspicion of type 1 diabetes, symptoms of diabetes for less than 2 months, pregnancy, hemoglobinopathies, medications that may result sudden increase in glucose, anemia, renal failure, HIV infection, malignancies, severe chronic hepatic, and renal disease.
3. Any sample with >15% should be suspected of having a haemoglobin variant.
