BIOCHEMISTRY

TEST(Methodology)	RESULT	UNITS	BIOLOGICAL REFERENCE INTERVAL
Glycosylated Haemoglobin (Hb A1c)*	4.7	%	< 5.7% : Normal 5.7% - 6.4% : Prediabetes > 6.4% : Diabetes
Method: High Performance Liquid Chromatography (HPLC)			
MEAN PLASMA GLUCOSE (MPG) ESTIMATE*	88	mg/dL	Excellent control : 90 to 120 Good control : 121 to 150 Average control : 151 to 180 Panic value : > 211
Method: Derived from HBA1c			

Note: Mean Plasma Glucose is calculated from HBA1c value and it indicates Average Blood Sugar level over the past three months.

MEDIWHEEL FEMALE 30 TO 45 YRS

INTERPRETATION :

1. Glycated hemoglobin (glycohemoglobin /HbA1c) is a form of hemoglobin (Hb) that is chemically linked to a sugar.
2. A1c is measured primarily to determine the three-month average blood sugar level and can be used as a diagnostic test for diabetes mellitus and as an assessment test for glycemic control in people with diabetes.
3. In diabetes, higher amounts of glycated hemoglobin, indicating poorer control of blood glucose levels, have been associated with cardiovascular disease, nephropathy, neuropathy, and retinopathy.
4. American diabetes Association (ADA) recommends an A1C goal for many non pregnant adults of < 7% (without significant hypoglycemia). On the basis of provider judgment and patient preference, achievement of lower A1C levels than the goal of 7% may be acceptable, and even beneficial, if it can be achieved safely without significant hypoglycemia or other adverse effects of treatment. Less stringent A1C goals (such as < 8%) may be appropriate for patients with severe hypoglycemia, extensive co morbid conditions etc, or where the harms of treatment are greater than the benefits.
5. Glycemic goals for some older adults might reasonably be relaxed as part of individualized care, but hyperglycemia leading to symptoms or risk of acute hyperglycemia complications should be avoided in all patients.

Note: Change in method and reference range

**NOTE:**

TSH - Reference ranges during pregnancy:\*

1st Trimester : 0.10 - 2.50

2nd Trimester : 0.20 - 3.00

3dr Trimester : 0.30 - 3.00

\*As per the Guidelines of American Thyroid Association for the diagnosis and management of thyroid disease during pregnancy and post partum.

1.Primary Hyperthyroidism is accompanied by elevated T3 & T4 values along with depressed TSH level.

2.Primary Hypothyroidism is accompanied by depressed T3 & T4 levels and elevated TSH levels.

3.Normal T4 levels accompanied by high T3 levels are seen in patients with T3 Thyrotoxicosis.

4.Slightly elevated T3 levels may be found in pregnancy and estrogen therapy, while depressed levels may be encountered in severe illness, malnutrition, renal failure and during therapy with drugs like propranolol and propylthiouracil.

5.Although elevated TSH levels are nearly always indicative of primary hypothyroidism, rarely they can result form TSH secreting pituitary tumors(secondary).
